## ADVERTISEMENT.

THE unfortunate death of Sir William Fones, on the 27th of April, 1794, having deprived the Society of their Founder and President, a meeting of the Members was convened on the Ist of May following, when it was unanimously agreed to appoint a Committee, consisting of Sir Robert Cbambers, Mr. Justice Hyde, Colonel $\mathcal{F}$ obn Murray, Fobn Briston, and Thomas Grabam, Esquires, to wait on Sir Fobn Sbore, and, in the Name of the Society, request his acceptance of the office of their President. With this request he, in terms highly flattering to the Society, agreed to comply; and on the 22d of May, 1794, took his seat as President, and delivered the Discourse, No. 12, of this Volume.

EDMUND MORRIS, Secretary.

## THE TENTH

## ANNIVERSARY DISCOURSE,

delivered 28 february, if93,

## BY THE PRESIDENT,

## ON ASIATIC HISTORY,

## CIVIL AND NATURAL.

BEFORE our entrance, Gentlemen, into the Disquisition promised at the close of my ninth Annual Discourse, on the particular advantages which may be derived from our concurrent researches in Asia, it seems necessary to fix, with precision, the sense in which we mean to speak of advantage or utility. Now, as we have described the five Asiatic regions on their largest scale, and have expanded our conceptions in proportion to the magnitude of that wide field, we should use those words, which comprehend the fruit of all our inquiries, in their most extensive acceptation; including not only the solid conveniences and comforts of social life, but its elegances and innocent pleasures, and even the gratifi-
cation of a natural and laudable curiosity; for, though labour be clearly the lot of man in this world, yet, in the midst of his most active exertions, he cannot but feel the substantial benefit of every liberal amusement which may lull his passions to rest, and afford him a sort of repose without the pain of total inaction, and the real usefulness of every pursuit which may enlarge and diversify his ideas, without interfering with the principal objects of his civil station or oconomical duties; nor should we wholly exclude even the trivial and worldly sense of utility, which too many consider as merely synonimous with lucre, but should reckon among useful objects those practical, and by no means illiberal arts, which may eventually conduce both to national and to private emolument. With a view then to adrantages thus explained, let us examine every point in the whole circle of arts and sciences, according to the received order of their dependence on the faculties of the mind, their mutual connexion, and the different subjects with which they are conversant: our inquiries indeed, of which Nature and Man are the primary objects, must of course be chiefly Historical; but since we propose to investigate the actions of the several Asiatic nations, together with their respective progress in science and art, we may arrange our investigations under the same three heads to which our European analysts have ingeniously reduced all the branches of human knowledge ; and my present address to the Sociecy shall be confined to history, civil and natural, or the observation and remembrance
membrance of mere facts, independently of ratiocination, which belongs to philosophy; or of imitations and substitutions, which are the province of art.

Were a superior created intelligence to delineate a map of general knowledge (exclusively of that sublime and stupendous theology, which himself could only hope humbly to know by an infinite approximation) he would probably begin by tracing with Newton the system of the universe, in which he would as. sign the true place to our little globe; and, having enumerated its various inhabitants, contents, and productions, would proceed to man in his natural station among animals, exhibiting a detail of all the knowledge attained or attainable by the human race; and thus observing perhaps, the same order in which he had before described other beings in other inhabited worlds; but though Bacon seems to have had a similar reason for placing the history of Nature before that of Man, or the whole before one of its parts, yet, consistently with our chief object already mentioned, we may properly begin with the civil history of the five Asiatic nations, which necessarily comprises their Georraphy, or a deseription of the places where they have acted, and their Astronomy, which may enable us to fix with some accuracy the time of their actions; we shall thence be led to the history of such other amimals, of such minerals, and of such regretables as they may be supposed to have found in their several migrations and settlements, and shall end with the uses to which they have applied, or may apply, the ricl assemblage of natural substances.
I. In the first place, we cannot surely deem it an inconsiderable advantage, that all our historical researches have confirmed the Mosaic accounts of the primitive world; and our testimony on that subject ought to have the greater weight, because, if the result of our observations had been totally different, we should nevertheless have published them, not indeed with equal pleasure, but with equal confidence; for Truth is mighty, and, whatever be its consequences, must always prevail: but, independently of our interest in corroborating the multiplied evidences of revealed religion, we could scarce gratify our minds with a more useful and rational entertainment than the contemplation of those wonderful revolutions in kingdoms and states, which have happened within little more than four thousand years; revolutions almost as fully demonstrative of an all-ruling Providence as the structure of the universe, and the final causes which are discernible in its whole extent, and even in its minutest parts. Figure to your imaginations a moving picture of that eventful period, or rather a succession of crowded scenes rapidly changed. Three families migrate in different courses from one region, and, in about four centuries, establish very distant governments and various modes of society : Esyptians, Indians, Goths, Phenicians, Celts, Greeks, Latians, Chinese, Perwvians, Mexicans, all sprung from the same immediate stem, appear to start nearly at one time, and occupy at length those countries, to which they have given, or from which they have de-
rived,
rived, their names. In twelve or thirteen hundred years more, the Greeks overrun the land of their forefathers, invade India, conquer Egypt, and aim at universal dominion; but the Romans appropriate to themselves the whole empire of Greece, and carry their arms into Britain, of which they speak with haughty contempt. The Goths, in the fulness of time, break to pieces the unwieldly Colossus of Roman power, and seize on the whole of Britain, except its wild mountains; but even those wilds become subject to other invaders of the same Gothic lineage. During all those transactions the Arabs possess both coasts of the Red Sea, subdue the old seat of their first progenitors, and extend their conquests, on one side, through Africa, into Europe itself; on another, beyond the borders of India, part of which they annex to their fourishing empire. In the same interval the Tartars, widely diffused over the rest of the globe, swarm in the northeast, whence they rush to complete the reduction of Constantine's beautiful domains, to subjugate China, in raise in these Indian realms a dynasty splendid and powerful, and to ravage, like the two other families, the devoted regions of Iran. By this time the Mexicans and Peruvians, with many races of adventurers variously intermixed, have peopled the continent and isles of America, which the Spaniards, having restored their old government in Europe, discover and in part overcome : but a colony from Britain, of which Cicero ignorantly declared, that it contained nothing: paluable, obtain the possession, and finally the so-
vereign dominion of extensive American districts; whilst other British subjects acquire a subordinate empire in the finest provinces of India, which the victorious troops of Alexander were unwilling to attack. This outline of human transactions, as far as it includes the limits of $A$ sia, we can only hope to fill up to strengthen, and to colour by the help of Asiatic literature ; for in history, as in law, we must not follow streams when we may investigate fountains, nor admit any secondary proof where primary evidence is attainable: I should, nevertheless, make a bad return for your indulgent attention, were I to repeat a dry list of all the Muselman historians whose works are preserved in Atabic, Persian, and Turkish, or expatiate on the histories and medals of Chima and Japan, which may in time be accessible to members of our Society, and from which alone we can expect information concerning the ancient state of the Tartars; but on the history of Indid, which we naturally consider as the centre of our enquiries, it may not be superflous to present you with a few particular observations.

Our knowledge of civil Asiatic history (I always except that of the Hebrervs) exhibits a short evening twilight in the venerable introduction to the first book of Moses, followed by a gloomy night, in which different watches are faintly discernible, and at length we see a dawn succeeded by a sun-rise more re less early according to the diversity of regions. That no Hinclu nation, but the Castemirians, have left us regular histories in their ancient language, we must ever lament;
but from the Sanscrit literature, which our country has. the honour of having unveiled, we may still collect some rays of historical truth, though time, and a series of revolutions, have obscured that light which we might reasonably have expected from so diligent ānd ingenious a people. The numerous Puranas and Itihasas, or poems mythological and heroic, are completely in our power; and from them we may recover some disfigured but valuable pictures of ancient manners and governments; while the popular tales of the Hindus, in prose and in verse, contain fragments of history; and even in their dramas we may find as many real characters and events as a future age might find in our own plays, if all histories of England were, like those of Iidia, to be irrecoverably lost. For example, a most beautiful poem by Somadera, comprising a very long chain of instructive and agreeable stories, begins with the famed revolution at Pataliputra, lyy the murder of king Nanda with his eight sons, and the usurpation of Chandragupta; and the same revolution is the subject of a tragedy in Sinscrit, entitled the Coronation of Chandra, the abbreviated name of that able and adventurous usurper. From these once concealed, but now accessible compositions, we are enabled to exhibit a more accurate sketch of old $I n$. dian history than the world has yet seen, especially with the aid of well-attested observations on the places of the colures. It is now clearly proved, that the first Purana contains an account of the deluge; between which and the Mohanmedan conquests the history of Vol. IV. ${ }^{\text {b }}$ beruine
genuine Hindu government must of course be coms. prehended; but we know from an arrangement of the seasons in the astronomical work of Parasara, that the war of the Pandaras could not have happened earlier than the clofe of the twelfth century before Christ; and Selencus must, therefore, have reigned about nine centuries after that war. Now the age of Vicramaditya is given; and, if we can fix on an Indiar prince contemporary with Seleacis, we shall have three given points in the line of time between Rama, or the first Indiun colony, and Chandrabija, the last Hindu monarch, who reigned in Behar; so that only eight hundred or a thousand years will remain almost wholly dark ; and they must have been employed in raising cmpires or states, in framing laws, improving languages and arts, and in observing the apparent motions of the celestial bodies. A Sanscrit history of the celebrated Vicramaditya was inspected at Benares by a Pandit, who would not have deceived me, and could not himself have been deceived; but the owner of the book is dead, and his family dispersed; nor have my friends in that city been able, with all their exertions, to procure a copy of it. As to the Mogul conquests, with which modern Indian history begins, we have ample accounts of them in Persian, from Ali of $Y e z d$, and the translations of Turkish books composed even by some of the conquerors, to Ghulum Husain, whom many of us personally know, and whose impartiality deserves the highest applause, though his unrewarded merit will give no encourage-
ment to other contemporary historians, who, to use his own phrase in a letter to myself, may, like him, consider plain truth as the beauty of historical composition. From all these materials, and from these alone, a perfect history of India (if a mere compilation, however elegant, could deserve such a title) might be collected by any studious man who had a competent knowledge of Sanscrit, Persian, and Arabic; but even in the work of a witer so qualified, we could only give absolute credence to the general outline; for, while the abstract sciences are all truth, and the fine arts all fiction, we cannot but own, that, in the defulizs of history, truth and fiction are so blended as to be scarce distinguishable.

The practical use of history, in affording particular examples of civil and military wisdom, has heen greatly exaggerated; but principles of action may certainly be collected from it; and even the narrative of wars and revolutions may serve as a lesson to nations, and an admonition to sovereigns. A desire, indeed, of knowing past events, while the future cannot be known, and a view of the present, gives often more pain than delight, seems natural to the human mind ; and a happy propensity would it be, if every reader of history would open his eyes to some very important corollaries, which flow from the whole extent of it. He could not but remark the constant effect of despotism in benumbing and debasing all those faculties which distinguish men from the herd that grazes; and to that cause he would irpupute the decided inferiority

2゙メ ON \&SIATIC HISTORT,
of most Asiatic nations, ancient and muntern, th those in Europe who are blest with happier governnocor:; he would see the Arabs rising to glo y, whie they adhered to the free maxims of their bold ancestors, and sinking to misery from the moment when those maxims were abandoned. On the other hanc, he would observe with regret, that such republicun governments as cend to produce virtue and happiness, cannot in their nature be permanent, but are generally succeeded by oligarizies, whith no good man would wish to be durable. He would then, like the king of Lydia, rememher Sulon, the wisest, bravest, and most accomplished of men, who asserts in form nervous lines, that "as hail andsuoze, which mar the labours of husband"men, procced from elevated clouts, and, as the de"structive thunderbalt follores the brituiant flash, thus "is a free state mined by men ewalited in power and "splendid in wealth, witite the people, from gross igno"rance, chuse tather to become the slaves of one tyrant, "s that they may escape from the domination of many, " than to preserve themselves from tyranny of any kind " by their union and their virtues." Sirce, therefore, no unmixed form of government could both deserve permanence and enjoy it, and since changes, cven from the worst to the best, are always attended with much temporary mischief, he would fix on our British constitution (I mean our public lure, not the actual state of limgs in any given period) as the best form ever established, though we can only make distant approaches to its theoretical perfection. In these Indian terri-
torics, which Providence has thrown into the arms of Britain for their protection and welfare, the religion, manners, and laws of the natives preclude even the idea of political freedom; but thcir histories may possibly suggest hints for their prosperity, while our country derives essential benefit from the diligence of a placid and submissive people, who multiply with such increase, even after the ravages of fanine, that in one collectorship out of twenty-four, and that by no means the largest or best cultivated (I mean Chirishana-nagar) there have larely been found, by an actual enumeration, a million and three hundred thousand native inhabitants; whence it should seem, that in all India there cannot be fewer than thirty millions of black Brilish sub. jects.

Ler us proceed to geograply and chroinology, without which history would be no certain guide, but would resemble a kindled vapour without either a settled place or a steady light. For a reason before intimated, I shall not name the various cosmographical bocks which are extant in Aralic and Persian, nor give an account of those which the Turks have betutifully printed in their own improved language, but shall expatiate a little on the geography and astronomy of India; having first observed generally, that all the Asiatic nations must be far better acquainted with their several countries than mere European scholars and travellers; that, consequently, we must learn their geography from their own writings; and that, by collating many copies of the same work, we may correct the
blunders of transcribers in tables, names, and descrip tions.

Geography, astronomy, and chronology have; in this part of $A$ sia, shared the fate of authentic history; and, like that, have been so masked and bedecked in the fantastic robes of mythology and metaphor, that the real system of Indian philosophers and mathematicians can scarce be distinguished : an accurate knowledge of Sanscrit and a confidential intercourse with learned Bralinens, are the only means of separating truth from fable; and we may expect the most important discoveries from two of our members; concerning whom it may be safely asserted, that if our Society should have produced no other advantage than the invitation given to them for the public display of their islents, we should have a claim to the thanks of our country and of all Europe. Lieutenant Wilford has exhibited an interesting specimen of the geographical knowledge deducible from the Puranas, and will in time present you with so complete a treatise on the ancient world known to the Hindus, that the light acquired by the Greeks will appear but a glimmering in comparison of that which he will diffuse; while Mr. Davis; who has given us a distinct idea of Indian computations and cycles, and ascertained the place of the colures at a time of great importance in history, will hereafter disclose the systems of Hindu astronomers, from Nared and Parasar to Meya, Varahamilizr, and Bhascar; and will soon, I trust, lay before you a perfect delineation of all the Indian asterisms in both hemispheres, where you will
perceive so strong a general resemblance to the constellations of the Greeks, as to prove that the two systems were originally one and the same, yet with such a diversity in parts, as to show incontestably, that neither system was copied from the other; whence it will follow, that they must have had some common source.

The jurisprudence of the Hindus and Arabs being the field which I have chosen for my peculiar toil, you cannot expect that I should greatly enlarge your collection of historical knowledge; but I may be able to offer you some occasional tribute; and I cannot help mentioning a discovery which accident threw in my way, though my proofs must be reserved for an essay which I have destined for the fourth volume of your Transactions. To fix the situation of that Palibothra (for there may have been several of the name) which was visited and described by Megasthenes, had always appeared a very difficult problem; for though it could not have been Prayaga, where no ancient metropolis ever stood, nor Canyucubja, which has no epithet at all resembling the word used by the Greeks; nor Gaur, otherwise called Lacshmanavati, which all know to be a town comparatively modern, yet we could not confidently decide that it was Patalifutra, though names and most circumstances nearly correspond, because that renowned capital extended from the confluence of the Sone and the Ganges to the scite of Patna, while Palibothra stood at the junction of the Ganges and Erannoboas, which the accurate M. D'Anville had pronounced to be the Yamma; but this only difficulty.
was removed, when I found in a classical Sancrit book, near 2000 years old, that Hiranyabahu, or golden-armsed, which the Greeks changed into Erannobous, or the siver with a lowely murnur, was in fact another name for the Sona itself; though Megasthenes, from ignozance or inattention, has named them separately. This discovery led to another of greater noment ; for ChanAragrpta, who, from a military adventurer, became, like Sandracoticus, the sovereign of $U_{p} p e r$ Hindustan, actually fixed the seat of his empire at Pataliputre, where he received ambassadors from foreign princes; and was no other than that very Sundracottus who concluded a treaty with Selencus Nicalor; so that we have solved another problem, to which we before alluded, and may in round numbers consider the twelve and three hundredih years before Christ, as two certain epochs between Rama, who conquered Silan a few centuries after the flood, and Vicramadifya, who died a Ujjayini fifty-seven years before the beginning of our era.
if. Since these discussions would lead us too far, I proceed to the history of Nature, distinguished, for our present purpose, froin that of Man ; and divided into that of other animals who inhabit this globe, of the imineral substances which it contains, and of the vegetables which so luxuriantly and so beautifully adorn it.
3. COULD the figure, instincts, and qualities of birds, beasts, insects, reptiles, and fish be ascertained, either on the plan of Buffon, or on that of Limneus, without giving pain to the objects of our examination, few studies would afford us mose solid instruction, or
more exquisite delight; but I never could learn by what right, nor conceive with what feelings a naturalist can occasion the misery of an innocent bird, and leave its young, perhaps, to perish in a cold nest, because ithas gay plumage, and has never been accurately delineated; or deprive even a butterfly of its natural enjoyments, because it has the misfortune to be rare or beautiful; nor shall I ever forgot the couplet of Firdarsi, for which Sadi, who cites it with applause, pours blessings on his departed spirit:-

Ah! spare yon emmet, rich in hoarded strain;
He lives with pleasure, and he dies with pain.
This may be only a confession of weakness, and it certainly is not meant as a boast of peculiar sensibiliiy ; but whatever name may be given to my opinion, it has such an effect on my conduct, that I never would suffer the Cocila, whose sild native wood-notes announce the approach of spring, to be caught in my garden, for the sake of comparing it with $B_{u f f}$ on's description; though I have often examined the donestic and engaging Mayana, which bids us good-norrow at our reindore's, and expects, as its reward, little more than security: cven when a fine young Manis or Päsgulim was brought me, against my wish, from the mountains, I solicited his restoration to his beloved rocks, because I found it impossible to preserve hin in comfort at a distance from them. There are several treatises on inninals in Arabic, and very particular acrounte of them in Chinese, with elegant outlines of
xxyi
their external appearance; but 1 have met with ned thing valuable concerning them in Persian, except what may be gleaned from the medical dictionaries; nor have I yet seen a book in Sanscrit that expressly treats of them. On the whole, though rare animals may be found in all Aiia, yet I can only recommend an examination of them with this condition, that they be left, as much as possible, in a state of natural freedom; or made as happy as possible, if it be necessary to keep them confined.
2. The history of Minerals, to which no such objection can be rinade; is extremely simple and easy, if we merely consider their exterior look and configuration, and their visible texture ; but the analysis of their internal properties belongs particularly to the sublime researches of Chemistry, on which we may hope to find useful disquisitions in Sanscrit, since the old Hindus unquestionably applied themselves to that enchanting study; and even from their treaties on alchemy we may possibly collect the results of actual experiment, as their ancient astrological works have preservect many valuable facts relating to the Indian sphere and the precession of the equinox. Both in Persian and Sanscrit, there are books on metals and minerals, particularly on gems which the Hindu philosophers considered (with an exception of the diamond) as varieties of one crystalline substance, either simple or compound: but we must not expect from the chymists of Asia those beautiful examples of analysis which have but lately been disp!ayed in the laboratories of Europe.
3. WE
3. We now come to Botany, the loveliest and most ropious division in the history of nature; and all disputes on the comparative merit of systems being at length, I hope, condemned to one perpetual night of undisturbed slumber, we cannot employ our leisure more delightfully than in describing all new Asiatic plants in the Linncan style and method, or in correcting the descriptions of those already known, but of which dry specimens only, or drawings, can have been seen by most European botanists. In this part of natural history we have an ample field yet unexplored; for, tho' many plants of Arabia have been made known by Garcias, Prosper Alpinus, and Forskoel; of Persia, by Garcin; of Tartary, by Gmelin and Pallas; of China and Japan, by Kcmpfer, Osbeck; and Thunberg; of India, by Rheede and Rumphius, the two Burmans, and the much lamented Koenig, yet none of those naturalists were deeply versed in the literature of the several countries from which their vegetable treasures had been procured ; and the numerous works in Sanscrit on medical substances, and chiefly on plants, have never been inspected, or never at least understood, by any European attached to the study of nature. Until the garden of the India Company shall be fully stored (as it will be, no doubt, in due time) with Arabian, Persian, and Chinese plants, we may well be satisfied with examining the native flowers of our own provinces; but unless we can discover the Sanscrit names of all celebrated vegetables, we shall neither comprehend the allusions which Indian Poets perpetually make to them,
nor (what is far worse) be able to find accounts of their tried virtues in the writings of Indian physicians; and (what is worst of all) we shall miss an opportunity, which never again may present itself; for the Pandits themselves have almost wholly forgotten their ancient appellations of particular plants; and, with all my pains, I have not yet ascertained more than two hund red out of twice that number, which are named in their medical or poetical compositions. Yt is much to be deplored, that the illustrious Van Rheede had no acquaintance with Sanscrit, which even his three Brakmens, who composed the short preface engraved in that langtage, appear to have understood very imperfectly, and certainly wrote with disgraceful inaccuracy. In all his twelve volumes I recollect only Panamava, in which the Nagari letters are tolerably right; the Hindu words in Arabian characters are shamefully incorrect ; and the Malabar, I am credibly informed, is as bad as the rest. His delineations, indeed, are in general excellent; and though Linnous himself could not extract from his written descriptions the natural character of every plant in the collection, yet we shall be able, I hope, to describe them all from the life, and to add a confiderable number of new species, if not of new genera, which Rheede, with all his noble exertions could never procure. Such of our learned members as profess medicine, will, no doubt, cheerfully assist in these researches, either by their own observations, when they have leisure to make any, or by communications from other observers among their acquaintance; who
may reside in different parts of the country: and the mention of their art leads me to the various uses of natural substances, in the three kingdoms or classes to which they are generally reduced.
III. You cannot but have remarked, that almost all the sciences, as the French call them, which are distinguished by Greek names and arranged under the head of philosophy, belong for the most part to history; such as philology, chemistry, physic anatomy, and even metaphysics, when we barely relate the phenomena of the human mind; for, in all bianches of know, ledge, we are only historians when we announce facts, and philosophers only when we reason on them: the. same may be confidently said of law and of medicine, the first of which belongs principally to civil, and the second chiefly to natural history. Here, therefore, I speak of medicine, as far only as it is grounded on experiment; and, without believing implicitly what Arabs, Persians, Chinese, or Hindus may have written. on the virtues of medicinal subjects, we may, surely, hope to find in their writings what our own experiments may confirm or disprove, and what might never have occurred to us without such intimations.

Europeans enumerate more than two hundred anul fifty mechanical arts, by which the productions of nature may be variously prepared for the convenience and ornament of life; and, though the Silpasastra reduce them to sixty-four, yet Abulfazl had been assured that the Hindus reckoned three hundreid arts and sciences: now, their sciences being comparatively few, we may.
conclude that they anciently practised at least as many useful arts as ourselves. Several Pandits have informed me, that the treatises on art, which they call Upavedas, and believe to have been inspired, are not so entirely lost but that considerable fragments of them may be found at Benares; and they certainly possess many popular, but ancient works on that interesting subject. The manufactures of sugar and indigo have been well known in these provinces for more than two thousand years; and we cannot entertain a doubt that their Saniscrit books on dying and metallurgy, contain very curious facts, which might, indeed, be discovered by accident, in a long course of years, but which we may soon bring to light, by the help of Indian literature, for the benefir of manufacturers and artists, and conseguently of aur nation, who are interested in their prosperity. Discoveries of the same kind might be collected from the writings of other Asiatic nations, especially of the Chinese; but, though Persian, Arabic, Turk. ish, and Sanscrit are languages now so acceffible, that, in order to attain a sufficient knowledge of them, little more seems required than a strong inclination to learn them, yet the supposed number and intricacy of the Chinese characters have deterred our moott dillgent students from attempting to find their way through so vaft a labyrinth. It is certain, however, that the diffculty has been magnified beyond the truth; for the perspicuous grammar by M. Fourmont, together with a copious dictionary, which I possess, in Chinese and Latin, would enable any man who pleafed, to compare the
CIVIL AND NATURAL.
original works of Confucius, which are eafly procured, with the literal translation of them by Couplet; and having made that first step with attention, he would probably find, that he had traversed at lealt half of his career. But I should be led beyond the limits assigned to me on this occasion, if I were to expatiate farther on the historical division of the knowledge comprised in the literature of Asia; and I muft postpone till next year my remarks on Asiatic Philosophy, and on thofe arts which depend on imagination; promising you with confidence, that in the course of the present year your inquiries into the civil and natural history of this eastern world, will be greatly promoted by the learned labours of many among our associates and correspondents.

SUMATRA,

BY JOHN MACDONALD, Esc.

## ON THE CAMPHOR OF SUMATRA.

IN answer to some questions put to me by the President of the Asiatic Society respecting camphoroil, I have the pleasure of giving the solution contained in the following short account :-Camphor-oil, one of the essential oils, is actually camphor, before the operations of nature on it have reduced it to the concrete form in which it is found in the tree. When Mr. Marsden composed his justly-admired history of Sumatra, the prevalent opinion on this subject was, that the oil and the concreted camphor were never found in the same tree. 1 have the authority of a gentleman, Lieutenant Lewis, well informed on this subject, from a residence of many years in the country producing the camphor, to differ from that generally accurate author, by saying, that he has seen a tree three quarters of a mile from the sea: Yol, IV.

B
nens
near Tappanooly, from which three calties (above three pounds) of camphor, and at the same time, near two gallons of oil had been procured. If a tree be old, and yield oil plentifully, the natives esteem these two circumstances sure indications of its containing a considerable quantity of camphor. Mr. Maccuer, in his chemical dictionary, has remarked, that the nitrous acid dissolves camphor without commotion, that the solution is clear and limped, and that it is called camphor-oil. This affords a proof that the formed camphor is produced from the oil by a natural operation of composition, the decomposition by means of the above solvent reducing the substance to its primary state, previous to concretion. The Achinese are reckoned the best judges of camphor; and the oil they collect undergoes a process by distillation, leaving a residum of inferior camphor. Trees of a certain age only yield camphor. It would seem that a certain time is requisite for maturing the oil to that state, when its contained camphor becomes fit for being concreted by the heat of the sun acting on the tree and soil. The camphor-tree is one of the Enneandria Monogynia of Linn sus, and differs in a small variation in the form of the leaf from the Arbor Camphorifera Japonica, folius laurinis, fructu parvo, calve brevissimo. The tree very much reembles the Bay in leaves. The trunk is thick; the bark of a brownish appearance; and the ramification strong, close, and extended. It is fond of a rich red loam, tending to a blackish clay, mixed with a crumbling stone of the colour of marl. It grows principally
on the N. W. side of Sumatra, from the line $3^{\circ} \mathrm{N}$. nearly. The wood is useful for domestic purposes; being soft and easily worked. It is by many imagined, that camphor is produced by a chemical process. This is a mistaken idea, farther than regards the inferior kind arising from the distillation of the cil. I shall give a brief account of the mode of obtaining and preparing it, as practised by the natives of Sumatra, from the time of the establishment of the English on the island. The Sumatrans, previous to their setting out in quest of camphor, assemble on the confines of the country they intend exploring, and discharge a variety of religious duties and ceremonies, calculated in their opinion, to promote the future success of their undertaking. They enter the woods, and, from ex: perience, soon distinguish such trees as contain camphor. They pierce them; and if they yield oil plentifully, it is presumed they contain concreted camphor, which is found in small whitish flakes, situated perpendicularly, in irregular veins, in and near the centres of the trees. The tree is cut down, divided into junks, and carefully divested of its camphor. When the oil has been drawn off from young trees; the camphor, which they afterwards afford, is of a less valuable nature, and is termed belly or foot camphor, in proportion to the degree of affinity it bears to head, or the best.sort. When brought for sale, it is repeatedly soaked and washed in soapy water, to separate from it all hetcrogeneous and sandy particles that may have adhered to it. When clean, it will sink in water, and be of a white, g!ossy, emooth ap.
pearance, tending to transparency. After it has been washed, it is passed through three sieves of differing textures, so as to be divided into head, belly, and foot camphor: certain proportions of each compose the chests made up for the China market, where they are sold for 350 . sterling, nearly. The capoor* (a word of Arabic origin) matee, or dead camphor, is carefully separated from the three divisions, by an acuteness of distinction, acquired by the eye and hand from habit and attention, and, being mixed with the imperfect kind mentioned above, is pounded in a mortar and distributed among proportional quantities of foot camphor. This capoor-matee is sometimes procured by boiling down the thickest part of the oil, or by taking the sediment of the best oil, after it has settled at least twenty-four hours. Camphor-oil is found to be a sovereign remedy for strains, bruises, and other exrernal pains, from its penetrating quality in entering the pores, and gently agitating the affected parts, so as to quicken the stagnated circulation. The internal, anodync and diaphoretic, and the external, antispasmodic and sedative virtues of camphor are well known. The oil is found to possess these in a certain degree, and to be useful in removing the painful spasms of the nerves and tencions, by dissipating the surrounding acrid humours. When the oil is used, it inust be formed into a liniment, as it would alone occasion pain from its strength. The oil applied to sores on horses has been found very beneficial. In this case it ought to be mixed with the

[^0]juice of the tobacco. Sumatra affords annually from fifteen to twenty peculs (of $133^{\frac{1}{3}}$ pounds each) of camphor, and more oil than there is at present a demand for. The Chinese purchase it; and it is not clearly ascertained whether they use it all in China, or make a factitious species of it, by admixture of Japanese camphor, for the Europe market: the latter is generally supposed. It is highly probable, that the price of camphor will, in process of time, rise to an enormous degree, as one tree in three hundred is not found to contain camphor, and, when found, is immediately cut down ; in consequence of which, the plant must soon become scarce, and the produce proportionably dear. It is to be hoped that the oil will, in this event, be found by the faculty to possess all the useful qualities of this valuable medicine. I have the satisfaction of accompanying this paper with a specimen, though a small one, of the camphor-wood, with a small quantity of the substance in it, the rest having ewaporated from length of time. If this account should afford any information to the President and Members of the Asiatic Society, my intention will be fully answered.

# THE CORAL 

of
SUMATRA.

IF this paper should be deemed worthy of a place in the Transactions of the Asiatic Society, the insertion I must still consider as an indulgence, and my attempt, a proof that I am more anxious than able, to encrease the general stock of Eastern natural knowledge, recorded in the useful annals of the Society. Specimens of coral, for your acceptance, and for the illustration of this su bject, are now forwarded.

The appearance of Sumatran coral does not altogether correspond with the descriptions of the plant hitherto given *. This induces me to describe such parts as are imperfectly represented. The plant, to which the various species of coral belong, is one of the Cryptogamiee of LiNN fus, and may be reckoned one of the Herbue Marince of Tournefort; of the Herbie imperfectice of Mr. Ray. It may be reduced to three colours, red, black, and whitish-yellow: the last is the most common in the Eastern seas. It is of a fungous texture, equally hard out of and in its natural element ; and its pores are charged with a juice of

[^1]a milky appearance, in some degree acrid. The bark covers every part of the tree, and contains a number of perforated papill.e terminating in tubes, having two or more holes in each, intended, I imagine, for the admission of the matter affording nutriment to the plant. The internal projections of the papillce adhere to the particles of sand and stone on which the coral grows, and are the only appearance of roots it exhibits. On examining the internal extremities of these papillce by means of glasses, some very fmall ramifications are discovered. These are very easily observed in the papille, which are attached to the bark of the root. The tree is said to grow to the height of two feet: I have seen some as high as ten feet. From these and other differences in appearance, I am apt to think that some Eurspean and $I n$ dian corals are not the same, but species of the same genis. From the very rapid growth of coral on the west coast of Sumatra, and in the Eustern seas in general, as will be shown in this paper, there can subsist but little doubr that it is a regetable substance; though there have not been wanting some, who have supposed it a fossil formed like crystals and spars; and others, eminent naturalists, who have ranked it among the animal tribes. Boccone discovered that this plant encloses a nutritious juice under its bark : and Count Marsigli remarked and observed its flowers and seeds. I shall here insert Marsigli's accurate experiment, which affords the decision of almost absolute demonstration in favour of coral being a vegetating plant. "Having steeped some B + coril.
coral, fresh-gathered in sea-water, he perceived, in a short time, that the little ruddy tubercles which appeared on the surface of the bark, began gradually to unfold, and at length opened into white flowers in the form of stars, with eight points which were sustained by a little calyx, divided, in like manner, into eight parts. Upon taking the coral out of the water, the flowers immediately closed, and returned into red tubercles as before; which tubercles, being closely squeezed, yielded a sort of milky juice: and upon returning the coral into the water as before, the rubercles, in an hour's time, opened, or flowered afresh; and this was continued for fix or eight days, when the buds, or tubercles, ceased to blow any more. In ten or twelve days they became detached from the coral, and sunk to the bottom, in form of little yellow balls. These tubercles then, according ro the analogy of plants, should be the flowers of coral ; and the miiky viscid juice contained therein, the pollen. Accordingly it is held, that when this juice falls on a properly-disposed body or nidus, a new coral arises therefrom; and the analysis of coral answers precisely to that of other sea-plants, all of them affording a volatile urinous salt, and a thick blackish fetid oil."---Elementa Chemiæ of Boerhaave, page $135^{\prime}$, Note, vol. i. \& Mem. de l'Acad. An. 1708.

Whether, after all, the striated papillce, which are of a stellar figure, and the two or more apertures of which are divided, generally, into twelve parts, contain an animal whose labour produces the growth
of the coral, or who inhabits the coral for its own immediate satisfaction, is a question that has been much agitated, without affording any certain conclusions. Monsieur de Peyssonnel, after having inquired into and discussed the various arguments for and against coral's being a petrification or a congelation, concludes that it is the work of an insect, which he denominates an Urtica, Purpura, or Polype, that contracts in air, expands in water, and is sensible to the touch, or the action of an acid. From Marsigli's experiment, as recited above, I think we may safely conclude, that $\mathrm{P}_{\mathrm{ys}} \mathrm{ysonnel}$ mistook the matter, and supposed a flower an insect; for it is well known that many flowers, on being plunged into an acid, will exhibit signs of contraction and movement. We observe many growing substances, which are inhabited by animals, or insects, merely for their convenience, and not to promote the growth of such substances, which they very frequently, on the contrary, retard. If an animal can be supposed to produce such immense bodies of this substance, as I shall have occasion to mention, whence does it derive the prodigious degree of nutriment requisite for the purpose, as it is not found that it quits the centre of its striated habitation? why do not these verniculi marini leave cells behind them, as they advance the growth of the coral? We find none, but, on the contrary, the surface uniformly smooth and even. As for the ex= ternal cells, they are the channels that convey nouzishment, and correspond to the fibres of plants. It must remain, however, in some degree, a doubr, whether
whether these marine productions are zoophytes, produced by the labour of animals, or whether they are produced on a vegetating principle. It will be difficult to bring this matter to the test of modern natural philosophy, viz. experiment : but till such can be made, opinions must be various, though the majority, and apparently (from Marsigli's experiment) the best founded, incline to the belief of corals being produced by vegetation. Having slightly reviewed both sides of this curious question, and having hazarded my own opinion, which can be of little weight, I come now to the intention of troubling the Asiatic Society with these remarks, imperfect as they must appear.

The production of islands, on the west coast of Sumatra, by the very rapid increase of this wonderful plant, is a remarkable effect of the operations of nature, hitherto unrecorded in the annals of natural philosophy. Mr. Dalrymple alone has alleged a fact, to which this account will add the weight of convincing testimony. In the year 1784, I was directed to survey the coast of the Dutch districts on the west side of the island of Surkatra. During the course of this survey, 1 had occasion to lay down on my charts several shoals, consisting of branched coral, sand, and such heterogeneous matter as they will resist and incorporate with themselves, when impelled against them by the action of the seas, winds, tide, or currents. The surfaces of these shoals were at various depths, from one foot to three or more fathoms. They are of a conical form, the base,
base, in proportion to the axis, being small. The shape gives them, in general, the appearance of trees of that figure, such as the poplar, \&xc. One of the shoals I visited, to the southwest of Pooloo Pinang, near Padang, was at that time covered by two feet and an half of water, and could not be distinguished by vessels passing at some distance, but at such times as the winds produced a swell or agitation on it. I passed along this part of the coast in February 1789, very close to this shoal, just four years and seven months after the period at which the survey had been taken; and was not a little astonished to observe a simall sandy island, about ten yards in diameter, having a few bushes growing on it, formed on the top of the shoal, which lies nearly in thirtyseven fathoms of water. I could not mistake this shoal, as there was no other contiguous to it, and as my chart, by which I suggested the safest course to run in, then lay before me. In May and September 1789, I had an opportunity, in going to and returning from Tappanooly-harbour (which I had been directed to survey) to be again on several of the shoals included in my chart of the coasts of the Dutch-districts, and, according to my expectations, found the depth of the water on them considerably diminished since the survey had been taken. In March 1790, I was sent for by a gentleman at Fort Marlborough, whose house commanded a view of the fea, to observe the water breaking on two shoals in the roads. This gentleman had resided on the coast near fifieen years, pad frequently in this house, without having observ-
ed these shoals, which, had they appeared at any former period, must have been remarked, their situation being clearly and distinctly exposed to the daily and immediate observation of the settlement. At, the distance of seven miles from Fort Marlborough, nearly in a south-west direction, there is a small island, having a few cocoa-nut trees in it. Thinty miles (or it may be twenty-five) distant from this island, one of the northern pepper settlements, is situated on a rising ground. The gentleman residing there has informed me, that he has always been able to distinguish the masts of vessels lying at anchor near this island, and that he lately twice distinctly, in the proper bearing, observed the trees of the island: but that, afterwards, from hazy weather, or some other affection of the atmosphere, he could not perceive the island, or rather the trees on it. Former residents of Laye, the place of obscrvation, have, in vain, when using the best glasses, looked for this island, invisible till lately. Such are the stubborn facts which may be adduced in proof, not only of the very rapid growth of corat, but also of the formation of islands from it, as a necessary, and observed, consequence. The growth of coral alone may not produce this effect: other aiding circumstances may intervene. Boccone and Marsigil have remarked, that, when coral meets with stones, coarse sand, or any other substances, it seizes them firmly, and speedily includes them within a strong extension of its close ramifications. These collections in seas, subject to frequent storms and agitations, must be considerable *
siderable, and promote, in no small degree, the elevation of islands. Earthquakes are very frequently felt on this island, and on the contiguous ones. Several shocks are sometimes experienced during the course of a month. It is observable that this tremendous phenomenon, in its progress, undulates the space it moves, or travels, under; and that the concave parts of these undulations open into firsires when the motion is violent. It is not improbahle but that such openings take place under shoals, or immediateIy contiguous to them. In this case, to preserve the equilibrium, it scems reasonable to suppose that the surrounding sand and substances will rush in, hurried along by the general movement, in a greater quantity, from the degree of momentum impelling them, than what occupied the space of the fissure when at rest. These hiatus take place only on the side of the undulation, from which the carthquake proceeds; and the sand on that side, now inclining to rest, after having experienced the shock, but still possessing a iendency to move in the direction of the earthquake, will naturally fall into the hiatus opened for its reception, before the undulation can reverberate into its original position. Hence the shoal, or island, will be in some degree raised, by an effect similar to that of a lever, though by different means. These islands and shoals, being further removed than orher parts exposed to the shock, from the subtertaneous or submarine crannies or channels in which the earthquake acts, will, of course, resist its action more than parts possessing less incumbent weight. The
undulations will, therefore, meet with more resistance, and deposit a greater quantity of sand than in situations resisting less. In the formation of islands, from coral and sand, as soon as the sand appears above the surface of the water, birds carry roots and various seeds attached to them, for the, construction of nests: hence the speedy appearance of bushes and trees. Instead of supposing with some, that the numerous islands on this coast have been formed by the violent commotions of nature, occasioned by earthquakes, which separated them from the continent on the above principles, it is more reasonable to suppose their formation on the above principles, and chiefly by coral: more especially, when we consider that the depth of water between many of these islands and Sumatra is unfathomable. The numerous clusters of islands in the eastern seas, from 36 to 16 degrees east longitude, are all supported. by bases of coral, and surrounded by shoals emerging from the surface, or pushing their conical frusta into a new element. Experience has asceramined the formation of islands from coral : it is not altogether conjecture to suppose that various groups of islands, in the great eastern Archipelago, will, in process of time, become continents, or insular tracks or spaces of land. On the coast of Coromaid del, in the immediate front of Mau'ras; exposed anchorage has produced, and produces annually, lamentable accidents, attended with much public detriment. The position of a sheltering island in that situation would be an object of natiopal, benefit and private safety and advantage. To
attempt to effect this, a considerable quantity of coral might be transported from this coast, at no great expence, and sunk, with stones and other substances, in seven, eight, or eleven fathoms of water, In the course, probably, of forty or fifty years, an island might be formed by the growth of this substance. This is a long period to look forward to for the benefit of futurity; but from what 1 have, from my own observation, inserted in this paper, I am convinced of the practicability and success of a scheme, which many will treat as chimerical and visionary, while others, more thinking, will see the utility of the design and probability of success; but will be deterred by the difficulty and tediousness which would attend the execution.

## REMARK BY THE PRESIDENT.

It seems at length to be settled among naturalists, that corals and corallines are the cretaceous habitations of animals, and one of the links in the great chain of nature. The idea of making islands for the protection of ships at anchor, is very sublime; but it might be feared, that very dangerous reefs of coral would be formed, before an isle could appear above the water: an artificial embankment of coral might, perhaps, on some coasts, be a powerful barrier against an encroachment of the sea.

ON

## THE COPPER OF SUMATRA.

IHAVE the satisfaction of laying before the Asiatic Society a specimen of copper-ore, the production of the island of Sumatra. It is found on and in the hills of Muachy near the sea, between Annalaboo and Scossoo, to the north of our extreme English settlement of Tappanooly. The soil, which generates the ore, is a mixed loam, consisting of elay, small stones, and red sand, founded on an underscil of soft rock, intersected with veins of this useful . substance. The space affording the ore is considerable; extending above a degree in length, and further east, or into the country, than has been yee ascertained. A considerable quatitity of ore is annually collected on the surface of the hills; to which the indolence or ignorance of the inhabitants, at present, confines their search. Its being found on the surface, may probably be ascribed to the efforts of earthquakes, which are very prevalent on this coast, and over the island in general. The natives, from inexperience, are incapable of conducting a mine, and pursuing a metallic vein. They are
content with excavating the ore, till their labour is interrupted by the flowing of the water, which soon takes place in a country subject to heavy rains throughout the year. As many of these veins widen as far as they have yet been traced, it is more than probable that these hills contain inexhaustible mines of this metal. The ore, by repeated smeltings, and other operations to free it from its sulphur, has been reduced to a metal, and then found to include a considerable proportion of gold. As no part of the world contains a greater quantity of this latter metal than Sumatra, in proportion to the area it occupies on the globe, it is probable that the discovery of gold mines would attend the establishment of copper ones in the hills of Ainalaboo. This is so much the more probable, as metalline stones, of various kinds, and which the Malays regard as sure indications of a soil affording gold, are found on these hills; independently of the consideration, that gold-dust is collected in the immediate neighbourhood, and in the interior country, contiguous to the hills yielding the copper-ore. It is singular, that the same method of rough smelting, which is practised at Goslizw in Germany, should be in use among the uncivilized inhabitants of Sumatra. The Sumatran method possesses more ingenuity, and is, at the same time, more simple. An ùndemonstrated knowledge of the plainest and most obvious principles of science, is congenial to the most rude as well as to the most civilized conceptions; and the advantages which the talents of born genius have conferred on

Europe, are by no means a conclusive proof of the inferiority of intellect which the fortunate inhabitants of Europe liberally bestow on their less enlightened brethren of the East and West. That " time and chance happer unto all things under the sun," is a truth that amounts to a voluminous disquisition on this subject. But to return. The oregatherers chuse a level spot of hard clay, which they divide into equidistant points, by lines intersecting each other, and laid off equally on two sides of a square. These points, included in the square space, they surround with circles, of which the points are the centres. The circles are inverted bases of cones, excavated to receive the fuzed metal. The smelting space is now covered with wood, charcoal, and other combustible matters, and the ore is distributed among these admixtures. The meited ore is received into the formed holes, leaving the scorix or recrement above. The metal, stili requiring many smeltings to render it fit for use, or perfectly malleable and ductile, is taken out in the form of pointed eakes, and sold for twenty Spanish dollars per pecul, or five pounds sterling for $133 \frac{\frac{\pi}{3}}{3}$ pounds avoirdupois weight. The natives are particularly careful in preventing accidents; for, previously to fusing the ore, they heat the ground to a great degree, in order that all the water near the surface may be absorbed, or made to exhale; having experiencelt, I imagine, that copper when in a state of fusion, meeting the smallest quantity of water, will fly in all directions,
with a force destructive of every vulnerable substance within the sphere of its action. I have been informed, that the metal has been eliquated at Macras lately, and found to contain very little appearance of any other but of gold. The usual solvents, aquafortis, aqua regia, and spirit of salts, readily dissolve the Sumatran copper. A deep green solution is produced, in a very short time, by the action of the weaker acids on the rough ore. The above method of smelting will separate all coarse, mineral, and heterogeneous substances from the metal, but will still leave it strongly impregnated with its peculiar mineral earth. The detaching of this mineral carth is the most difficult and expensive operation attending the refinement and purification of copper; it being frequently necessary to add a proportion of another metal to effect it. This consideration will, probably, prevent a private company from applying for public permission to work these mines; and, therefore, they must remain in their present state, unless the East India Company will order the experiment to be made, from the reports and opinions of such as may be qualified to give them on so interesting a subject. By submitting this short account to the gentlemen of our Society, whose useful rescarches, will, I hope, produce permanent national benefit, by adrancing the knowledge of nature, of science, and of literature, opinions properly weighed, will be diffused among the public, of the advantages that may result from an establishment for working copper-mines on the west coast of Sumatra.

# THE PLANT MORINDA, 

AND
ITS USES.

BY WILLIAM HUNTER, ESQ.

ALTHOUGH the plant, which is the sulject of this essay, be not a new species, yet, as it is cultivated to a great extent in Málara, and forms an important branch of the commerce of that province, I hope a particular description of it, with some account of its culture and use, will not be unacceptable to the Asiatic Society.

It is the Morinda of Linneus: It belongs to the order Pentandria Monogynia in his system, and is referred by him to the natural order of Aggregatce. Here (though it may seem a digression from the subject) I cannot help observing, that Linnmes is not altogether consistent in the distinction, which he endeavours to establish, between the aggregatic (properly so called) and the compound flowers. In his Philosophia Botanica, § 116. he defines a compound flower to be "that which has a broad entire re"ceptacle, and sessile florets;" and an aggregat.e fower, "that which has a broad receptacle, and forets supported on peduncles." According to these definitions, the Morind ought to be placed among the comfound flowers; but in the following section, Lin=

NEUS makes the essential character of the compound flowers to consist in having all the anthers united: thus restricting it to his class of Syngenesia. This not only excludes the Morinda, but ought perhaps t have, strictly speaking, excluded the Kuhnia, Iva, and Ambrosia: and even, allowing the approximated anthers in these genera to come within the meaning of the definition, it seems unaccountable that the Nauclea (a), which appears so well entitled to a place in one of these orders, should be excluded from borh.

The Aal is a tree of middling size; the root branchy; the trumk columnar, erect, covered with a scabrous bark.
Branches from the upper. part of the trunk, scattered; of the structure of the trunk.
Leares (seminal) oval, obtuse, entire.
(mature) opposite, decussated, ovate, pointed at both ends, smooth, with very short petioles.
Stipules lanced very small, withering.
Peduncles, from the axils of the leaves, solitary, bearing an aggregatre flower. Calyw: common receptacle roundish, collecting the sessile flowers into an irregular head.
Periauth most entire, scarce observable above. Coral, one-petaled, funnel-form; Tibe cylindric; Border five cleft; the dirizions lanced.
Stamen: Filaments five, thread-form, arising from the tube, and adhering to it through two thirds of their length, a little shorter than the tube.

## (a) The Gadam of the Hindoos.

Anthers linear, erect.
Pistil: Germ beneath*. Style thread-form, longer than the stamens. Stigma two-cleft, thickish.
Pericarp: common, irregular, divided on the surface into irregular angular spaces; composed of berries pyramidal, compressed on all sides by the adjacent ones, and concreted with them, lopped, containing, towards the base, a fleshy pulp.
Seeds in each berry four, towards the point oblong, externally convex, internally angular.
The species here described is called by Linneus Morind, arborea pedunculis solitariis; and he gives it the trivial name of citrifolia; but the form of the leaves, in all the specimens I have seen, does not exhibit this similitude, as will appear by the inspection of the accompanying figure, which was drawn from nature. There are figures of it given by Rumphius (Herb. Amboin. vol. 3. tab. 99) who calls it Bancudus latifolia, and by Rheede (Hort. Malab. vol. 1 . tab. 52) who calls it Cada-pilava. In Malava it is called Aul, and in Oude it has the name of Atchy.

The plant grows best in a black rich soil, free from stones, in situations moderately moist, not too high, yet sufficiently elevated to prevent the water of the rains from stagnating; and where there is near at hand a supply of water for the dry montlis. It is zown about the middle or end of June, after the rain has begun to fall. The ground requires no manure;

[^2] sepd...
it is ploughed twice; or, if tough and hard, three times. The feed is sown, either broad-cast, or in drills, according to the fancy of the cultivator. The ground is then ploughed over again, and harrowed: In one beegali* of ground are sown, from $1 \frac{x}{2}$ to $2 \frac{1}{2}$ muns $\downarrow$ of seed. In fifteen or twenty days the young plants spring up. The field is then carefully weeded, and the grounds stirred with an iron instrument. This operation is repeated, at proper intervals, during the first year; and in the dry months of that yeur (that is, from January till Jume) the ground is three or four times laid under water, After the first year, it requires no farther care. In a year the plant grows to the height of one or two feet, according to the quality of the soil. In the third year, sometimes in the second, it bears flowers and fruit. The flowers appear in June, and the fruit ripens in September or October: but the fruit of those young trees is not used for seed, as it is said not to produce vigorous plants. In the months of February and March following the third year, the plants are dug up. They dig, to the depth of three or four feet; the root, which is the only valuable part, extending so far into the ground. The wood of the plant is only used for fuel. Sometimes the neceffities of the husbandman oblige him to dig the crop in the second, or even at the end of the

* A meafure of one hundred cubits square.
$\dagger$ The mun of this country is sixteen secis, of eighty rupees weight each.
frrst year; but the root is obtained in much smaller quantity, and less rich in colouring matter than if it had remained the regular time. The crop is not much affected by the excess or defect of the periodical rains. When it is dug at the end of the third year, one beegah yields from four to six maunies* of the root in a wet state. These are spread on cloths, and dried in the sun, for three or four days; at the end of which time there remains of dried root, one third or one fourth part of the original weight.

As the colouring matter resides chiefly in the bark of the root, the small twigs, which contain little wood, bear a higher price than the larger pieces. Therefore the roots, when dug up, are separated into three kinds, coarse, medium, and fine. The coarse sells for one rupee per mun, the medium two or three rupees, and the fine four rupees per mun, or four seers for a rupee.

In particular fields they leave trees for seed at the distance of four, five, or six cubits. In six years they yield fertile and vigorous seeds. The trees, when of that age, are about six inches in diameter, and twelve feet high (branches included) ; but they continue fruitful for many years, and are said to grow to a size not much inferior to that of a Mango-tree. When the fruit is ripe, it is gathered, laid in heaps on the ground, and covered up with straw, or other rubbish, for fifteen or twenty days, in which time the pulp rots, and is consumed. It is then put into a basket, and washed, by repeated effusions of water, to

[^3]separate the seeds, and free them from the remains of the pulpy matter. The husbandman, who cultivates this plant, generally takes care to have on his ground a sufficient number of trees for seed. If he is unprovided with those, he may purchase the seed, immediately after it is prepared, for four or five rupees the mun; but if he neglects to purchase till the season of sowing arrives, he may be obliged to pay at the rate of two seers per rupee.

In the ground on which Aal has grown, they sow wheat, or other grain, for five or six years; and, it is observed, that the grain sown on this ground thrives remarkably: and while the trees left for seed continue small, grain of any kind may be sown in their interstices; but $A a l$ would not thrive there.

The expence to the cultivator varies considerably in different villages. In one, where the plant is cultivated to considerable extent *, the pateil, or zemindar, gave me the following account of the expence attending the culcivation of one beegah.

To the Collector of the District Rs. Io
To the Piteil, - . - I
To Writers, \&c. Servants of the Pateil, 010 To digging up the Root*
${ }^{1} 5$

Now supposing, agreeably to the foregoing ac-

* Kbelana, $7 \frac{1}{2}$ miles from Oujcin.
+ For digging a space 16 cubits long, and $3 \frac{1}{2}$ cubits broad, the labourers are paic $4^{\frac{1}{4}}$ pice, at fifty to the rupee.
count, that a good crop is six, and a bad one four, maznies; that each many yields, when dried, $3 \frac{\frac{3}{2}}{2}$ muns, and that in this dried root, the coarse at one rupee, the medium at two, and the fine at four, are in equal quantitics; then, the value of the good crop will be forty-nine rupees, and that of the bad one $32,10,8$. The first of these leaves Rupees 22,6 , the other Rs. 6, 0, 8, from each beegah. The medium, Rupees 14, 3, 4, we may estimate as the profit of the husbandman, out of which he is to maintain himself and his cattle for three years. In this account I have not included the expence of secd, as the cultivator is generally supplied with it from his own trees. Had he been obliged to purchase it, we must have added eight rupees to the expence of cultivation: but, as the crop sustains no damage by remaining in the ground, the cultivator can dig it up at his leisure; and therefore he generally saves by his own labour great part of the expence above stated for digging.

In another village *, the cultivator has the land on much easier terms; only paying three rupees for the crop, or one rupee yearly, to the collector. Therefore, the other expences being supposed the same, the crop only costs him Rs. I9, 10, besides his own maintenance and that of his cattle.

Bessdes the consumption of the root in the manufactures of this province, large quantities of it are $\mathrm{ex}-$ ported to Guzerat and the northern part of Hinclostan. I have not been able to learn the exact value of this

[^4]exportation, but have reason to believe that it amounts, annually, to some lacs of rupees. The dealers, who come from those places (especially Guzerat) to purchase, advance money to the cultivator, and, when the crop is ready, buy it, either on the ground, or atter it is dug up. In the first case, they dig a small portion of the field, and, according to the quantity it yields, form a judgment on the value of the whole.

The method of dying with this root is as follows: The cloth to be dyed is thoroughly washed and scoured, with an extemporaneous kind of soap-lie, made by mixing the oil of sesamum with the fossil alkali. Then, supposing the cloth (which is generally of a thin texture) to be twenty-six cubits long, and one cubit broad, the quantities of ingredients will be - as follow.

Take of large Her * in powder, three ounces. Mix it well with four pounds of water. In this the cloth is to be thoroughly wetted, so that the absorption of Her may be as equal as possible It is then to be squeezed, and spread in the sun for about forty-eight minutes, to dry, taking care that no drop of water fall upon it. The cloth, when dried, is of a cream - colour. It is kept in this state for four or five days, that the particles of the Myrobalan may be more firmly attached.

Tirentake of powdered allum, two ounces; dissolve it in lb ij of water. Wet the cloth thoroughly

[^5]and equally in this solution. Wring it, and strike it genily on a smooth stone, then spread it, for twenty-four minutes, in the sun, to dry. When dried, it is of a pea-zreen colour. When perfectly diyy, it is kept for four day's, and then washed in cold water. To the manner and degree of washing, we are told, great attention is to be paid; as an error, either in excess or defect, would spoil the colour. When washed, it is dried in the sun.

Tue cloth thus prepared, is ready to receive the colour, which is prepared in the following manner. put $3^{\frac{1}{2}}$ gallons of water into an uncovered copperressel, and set it on a gentle fire. When it is something niore than lukewarm, put in the cloth, along with the colouring ingredients, which have previously been thus prepared. Take of $A a l$, from one to two seers, according to its quality, powder it, and rub it wiih two ounces of oil of Sesanmum to each seer. Add of the flowers of $D_{2}$ havery, * one-eighth of a seer 10

* A shrub, which grows wild on the hills, and on the banks of the rivulute, where they are formed of a grassy sod. The flowers are of a beautiful red colour, and are gathered both for the use of the dyers and of the aporthecaries, who give an infusion of theni as a cooling medicine. They lose their colour in drying, and only gield a slight brownish tincture to water; so that the benefit derived from them in dying with Aal, seems to depend me:ely on their action as an astringent; which is confirmed by the substitution of $P$ urweiss, a strong astringent, as an equivalent to $D$, bawiy. The natural character of the $D$, burury is as follows:

Cal. Perianth one-leaved, persistent: Tubr, bellied; Border, six cleft ; the divisions lanced, erect.

Cor. Petals six, lanced, acute, erect; a little longer than the caly $x$,
to each seer of Aal; or, instead of $D$, hawwry, one ounce and a half of $P_{\text {urveras }}$ *, in powder.

Tue cloth and colouring ingredients are continued on the fire, with a gentle heat, gradually increased, for about three hours. Towards the end, the water is made to boil strongly. By taking up a little of the water, and examining its colour, as it is dropped in the vessel, they judge of the success of the process. It ought to be of a clay-colour, or a little deeper. If it proves very red, the colour would calyx, arising from the edge of the tubc, between the divisions of the calyx.
Stam. Filaments twelve (in some ten or eleven) awled, erect, longer than the calyx, and arising from it. Aisters kidney form, incumbent.
Pist. Germo oblong, two-furrowed. Style awled, ascending, the lengti of the stamina. Stigma obtuse.
Peric. Capsule, ovate, acute, two-furrowed, two-celled, fourvalved.
Seeds numerous, very small: receptacie oblong.
Leaves opposite, lanced.
Here the oblong shape of the capsule and its two cells agree with the Lythrum; the divisions of the caljx with the Ginora. LisNatus ( Ph . Bot. § $177,182,183$.) alleges that the calys is more to be depended on than the Pericarpium in ascertaining the genera of plants. Thercfore, agreeabiy to these aphorisms, I should be inclined to refer the $D$, ba wery to the genius Giinora; but it miny perhips be considered as a new genus to be placed in the sysiten: between the Lytiorun and Ginora.

- A kind of gill-nut, containing the exurix of a small insect, found on a species of the Mirmosa. In Mâlava it is called $P_{\text {urswás, }}$, in Marsuar, Succont, and in the country about Monvother, Purwein. This being a stronger astringent, we are told that an exact attention to the proportion of it is more neceessary than to that of the D,bazwy.
be spoiled; and the remedy is, to add a larger proportion of $D$, kazery. During this process, the cloth is continually moved, by lifting part of it with a stick out of a ressel, beginning at one end and proceeding to the other. It is now taken out, wrung, and dried. After which, being washed in river-water. the red colour is complete. No. I is a specimen of this colour, which is valued more for its durability than its beauty.

## To make a Dark Purple, or Chócolate Colour.

Take of martial vitriol one ounce, dissolve it in two pounds of water, and clear the solution by decantation. Mix, with a quantity of the above-described colouring decoction, sufficient to wet the elorh, such a proportion of this martial solution as will give the tint required. This is judged by inspection, as the cloth will be of the same colour with the mixture. The cloth being taken out of the colouring decoction and wrung, is to be dipped into this mixture, and thoroughly weited, so as to absorb the colour equally and completely. Then, being dyed and washed, its appearance resembles that of the specimens No. 2 and 3 ; but the tints admit of a great variety, according to the proportions of the martial solution. Both these colours are very durable, being little affected by washing. One of the quarters of Oujein, named Jeysing poorah, is inhabited by dyers, who consume great quantities of this root. Their printed and stained cloths, besides supplying the domestic consumption, are exported to Guaerat. and other provinces.

ON

## THE INHABITANTS

of
TIIE HILLS NEAR RA'JAMAIIALL.
by LIEUTENAŃT THOMAS SHAW.

ASLIGHT knowledge of the language of the natives of the hills, in the districts of Bhágalpur and Rájamatuall, having brought to my observation that their customs and manners, as well as their language, differed from those of the inhabitants of the neighbouring plains, I have, for some time, endeavoured to acquire a good account of them, from the belief that, notwithstanding their connexion with and dependence on our government, they have been little known beyond the limits of the hills. The following description does not contain much more than a bare translation of what was written by the best in formed mountaineer whom I have met with. I have spared no pains to render it faithful ; for there alone it can have any merit. My information has been derived through a Soubadar of the Rangers (whom the late Mr. Cleeveiand had instructed in writing Nagree) as far as relates to the inhabitants of the hills in the three Tuppats of Mualjeway, Ghurry,
and Munnuáry. The first is to the south-west of Reir $^{2}$ jamahall, extending as far as Sicrigully; the second is thence in a westerly direction, as far as Shurohabad; and the third lies to the south of Ghurry, from whose people those on the borders of Bheerboom, and southeast of Rajamahall, differ in many respects. Whatever was material in these latter Tuppahs, was related by a Soubadar from that quarter to the one who can write; and both attended me in translating them. The tuppahs of Mudbun, Pyer, Chitoleah, Barcope, Putsundaw, Jumnee, IHurnah Par, Dumsai, Kuneeallahs, and others, have customs also peculiar to themselves. These I shall endeavour to ascertain.

The following relates immediately to the Tuppalis of Mudgervay, Ghurry, and Mumuary, from which may be collected what ideas the inhabitants have of one Supreme Being, of a future state, and of transmigration. It is true they worship many gods, but these are considered inferior to, and the medium of adoration of, one all powerful and omniscient Being; whom they cail Bédo Gossaiff, or the Great God. Their opinions on the metempsychosis, it is probable, have been borrowed from the Ifindus, though they profess no particular veneration for the cow, or any other animal; for they believe it a punishment when God ordains a human soul to transmigrate into any of the brute creation; and it is also a received opinion, that for certain crimes in this life, souls are condernned to the vegetable world.

The natives of the hills in these Tuppaks, having no knowledge of letters, or of any character, have a
traditional story, brought down from father to son (but in what age it was received, is now not known) that the Bedo Gossaif made heaven and earth, and all that is therein. To people the latter, seven brothers were sent from Heaven. At first they remained together; when the eldest brother was sick, the six younger collected all manner of eatables, which they agreed to divide, and to separate, to go into different countries; one, a Hindu, got fish and goat's flesh in a new dish, for his share ; a second, a Mussulman, was allotted fish, fowl, and every sort of flesh, except hogs, for his portion, in a new dish also; a third, Kirwary; a fourth, Keerrateer, got hog's flesh also in a new dish; a fifth, Kawdeer, got all sorts of flesh, fish, and fowl, in a new dish; a sixth, who was destined for a foreign country, got some of every sort of food, in a new dish; and after his departure, it was not known what had become of him, till Europeans made their appearance, when, from their manner of living, it was concluded that they were the descendants of the sixth brotber; the seventh, Mullare, who was the oldest, and sick brother, got some of every kind of food, but put them in an old dish, for which he was considered an outcast, and ordered to inhabit these hills, where, finding neither clothes rior subsistence, he and his descendants necessarily became thieves, in which practice they continued, till such time as Mr. Cleveland wisely conciliated their attachment to the English government, by a liberal generosity and munificence, while he entered their hills unattended, putting the utmose Vol, IV,

D
con-
confidence in their faith; and made engagements to settle on their chiefs an incorisiderable monthly sum, in consideration of their good and peaceable behaviour and obedience, to which they have rigidly adhered; and this, it is related, put an end to their predatory incursions and marauding. The Kirwary cast crossed the Ganges and lived in tents, having no settled habitation. The Hinchu and Mussulnuan remained in this country. The Karedeer went to the south ; and this remained doubtful, till a party of them came to dig a tank for Mr. Cleveland. The Kirrateer went to the north hills of the Ganges. I cannot learn what names the brothers had, nor how they were provided with wives, to increase and multiply : the creation of women does not bear any part in this defective account, which proceeds to relate, that God the Creator directed certain wombs to be fruitful. His commandments are, that men should give to such as will receive ; and that, in like manner, others would give to them. By labour men must live ; for this their hands were made; eyes were given to see with, the mouth to speak good and bad, as well as to eat sweet and sour, and the feet to walk. Abuse nobody without cause; neither kill nor punish, without a crime, or God will destroy you. These commands being sent, certain wombs were fruifful. But some men forgetting these divine ordinances, abused, beat, and oppressed each other without cause; when, the measure of their crimes being full, he summons them to his presence; the messenger carries sickness and death: On the sinner's appearing before God, being charg-
ed with forgetting his commandments, he is bound and caft into pits of maggots, or pits of fire, where he is to remain eternally.

Whoever keeps God's commandments, behaves well in all respects: he will neither injure, abufe, beat, nor kill, any person, nor seize their effects, nor plunder them, nor waste their grain, nor their money, nor their clothes, nor quarrel with any one; but praises God morning and evening; which last, the women also do. He will be charitable, clothe and feed the poor, and observe the festivals in GoD's name, with the proper expence of grain, money, and clothes. GoD, for the juft disposal of the goods he had granted, for keeping his commandments, and praying, summons the righteous person into his presence, on his having enjoyed this world long enough. On his appearance, he is asked how he dealt with men, and how they behaved to him. Having rendered his account, as well of what he bestowed and received as of what he ate; that he injured nobody, but praised God morning and evening,-God anfwers, "I saw that you behaved well, and kept my commandments; I will exalt you; in the mean time remain with me." After a short sojourn, he is fent to earth, to be born of woman again, and to be a Raja, Derwan, or Cutwall, with abundance of worldly goods and territory. Should he forget to praise God in his exaltation, and give not meat to the hungry, but oppress the poor, God, in his wrath, will destroy him, snatch him away, and accuse him of neglecting his commandments,
and forgetting 10 praise him. He will then cast him into a pit of fire, where, should not his punishment be external, he will not allow him to be born again of woman, but to be regenerated in the shape of a dog or a cat.

Whoever offends in the presence of God, is dismissed to this earth, to be born of women, either -blind, lame, or in poverty, never to have house, clothes, or victuals, nor any thing but what is begged from door to door. Should a person pos~ sessed of rank, grain, clothes, land, and every thing he could want, forget GoD's commandments, seize and plunder from others,-God, in his wrath for the abuse of the good things which he had bestowed, will make him poor and a beggar ; and having decreed that he shall remain a certain time on earth for his punishment, this being fulfilled, death snatches him away, and he appears in the presence of God. GOD orders a man to kill another, and he kills him, yet lives happily and content; but no one must, from his own will and pleasure, destroy a fellowcreature, or God will destroy him. God orders a man to beat another, and he beats him ; but whoever punishes a fellow-creature, without divine commands, the Supreme Being will direct a third person to punish the offender. No person shall abuse another without God's commands: whoever disobeys, will in like manner be abused by a third person.

Whoever without God's commands injures his neighbour, may expect divine retaliation. Should a man,
a man, seeing his neighbour's property, plunder or steal it, the Bedo Gossath will either order him to be punished in like manner, or some of his family to die. Should you see a man lame, mock not at his misfortune, lest God should make you lame, or punish you in some other manner. Laugh not at a man who has the misfortune to be blind, or God will afflict you in like manner, or some other way. It has pleased Providence that a man should have his back broken; whoever laughs at or mocks him, will be afflicted in like manner ; God will make him blind, or lame, or poor; therefore mock not the unfortunate. If God had made the lame, the blind, the broken-backed or poor, to be laughed at, he would have pardoned such as mocked them; but as their defects are punishments, those who are perfect should not deride their misfortunes. Those on whom God bestows grain, riches, land, and power, ought to be charitable, and to cherish the unfortunate, should they, notwithstanding their wealth, be uncharitable, Providence will punish them, by rendering them poor, and reducing them to the necessity of working for their bread. When great men are charitable, God will protect them.

God directs the poor to the rich man's doar to beg; should the latter uncharitably reflise to relieve their wants, Providence will be displeased at the abuse of the good things which he had bestowed, and will render the rich man poor, helpless, and destroy his family. God can exalt the poor man. Such are the dispensations and power of Providence.

A man robs and kills another, and casts the body away to conceal the murder from the relarions of the deceased, who conceive their kinsman to have been killed by a snake or a tiger ; but God cannot be deceived: vengeance will fall on the murderer, or his relations; he, or some of them, will fall a sacrifice to a tiger or a snake; divine vengeance will surely await him. Whoever kills a tiger without divine orders, will either himself, or some of his relations, fall a sacrifice to a tiger.

From such superstition, the natives of the hills are averse to killing at tiger, unless one of their relations has been carried off by one; when they go out for that purpose, and having succeeded, their bows and arrows are laid on the body of the animal, they innoke God, and declare that they killed it to retaliate for the loss of a relation. Vengeance thus satisfied, they vow not to attack a tyger, without the provocation of losing a kinsman.

God sends a messenger to summon a person to his presence: Should the messenger mistake his object, and carry off another, he is desired by the Deity to take him away; but as the earthly mansion of this soul must be decayed, it is destined to remain midway between heaven and earth, and never can return to the presence of God, Whoever commits homicide without divine orders, can never appear in the presence of the Deity.; bis soul is destined to remain mid-way between heaven and earth. Whoever is killed by a snake, as a punishment for some fencealed crime, can never appear in the presence
of the Deity ; his soul is doomed to remain mid-way between heaven and earch; yet God will destroy the snake : but, if it acted by Divine orders, Providence spares it. Should a rich man call the poor, with promises of giving them alms, and not perform them, and should the poor exhort God to make hin poor too, for his uncharitable deceit, Providence will either punish him in this way, or some other; but by penance and prayer he may be pardoned. As a man marries a woman at a great expence, should she be guilty of infidelity, and conceal the $\sin$ she had committed, which is the greatest aggravation of it, God will be incensed and punish her, by making her sick, lame, or blind. Whoever. commits fornication and conceals it, may dread divine vengeance. To avert falling sick, or being otherwise punished for his crime, he must avow it, pray to be forgiven, and sacrifice a goat at Devearry Nad, the shrine of their household God, the blood of which is to be sprinkled over the linen, to purify him, If a man casts a lustful eye on his neighbour's wife, God will punish him; for it is forbidden. Whoever takes poison and dies, can never go to Heaven; his soul will be doomed to wander eternally ; he will be convulsed and vomit, with no more than the daily allowance of as much rice as can be put on an aura-leaf (which is smaller than the tamarindleaf) and as much water, 'Whoeever hangs himself, shall never appear in the presence of God ; his soul will have no place assigned it; but he will be doomed to wander eternally with a rope about his
$\mathrm{D}_{4}$ neck.
neck. Whoever drowns himself, shall never appear in the presence of God ; his soul shall remain mid-way between heaven and earth; and God has ordained, that whoever drowns himself, shall be doomed to work eternally, day and night, without intermission, to make the crooked banks of a river straight, where the stream ever undermines, as fast as the lahourers incessantly work. Whoever, undirected by the Deity, has the misfortune of being killed by a fall from a tree, his soul is received into the kingdom of heaven, but not admitted into the presence of the Almighty: it is, however, served with such things as are provided for the righteous. Whoever receives favours, and is guilty of the ingratitude of abusing his benefactor, will not be well treated in other places; God will expose him to misery for his ingratitude. Whoever falls in battle, is well received by God, and fares sumptuously ; for the Deity is pleased with his fate. Whoever is lost travelling by water, is well received in Heaven : the Deity will take him unto himself.

The Demauno, or Dezvassy, seems to be more of an oracle than a priest. Those who wish to initiate themselves, represent that, by dreaming, they can foretell what will happen; that the Bedo Gossaif appears to them nightly, and braids their hair, from which it grows remarkably long; they must never cut it; as it is believed, if such an act did not prove fatal to them, that, at least, their dreams would no longer be prophetic. This oracle foretells to one person, that he shall have a plentiful harvest ;
to another, that he shall become rich; a third is told, that he is to fall sick; a fourth, that he shall die; a fifth, that he shall be successful in hunting. A family is admonished to sacrifice and pray at a certain shrine, to appease an offerded God; he prophecies when there will be a scarcity, and when it will rain. Thus, his predictions being verified, the people have faith in them; and one, who is sick, attends him for advice, which is afforded the following morning, when the Demauno has dreamt of the case, or Gov, having appeared to him in his vision, informed him what will be the fate of the patient, and what he must do to get well. Another informs him, his crops are not so good as usual, and desires to know which God is offended, and what he must do to appease him. A sportsman informs him, that he is not so fortunate as usual, and seeks to know what he must do to be so. Some ask, at what shrine they must make their offerings. All who confult this oracle must make a present, and return the following day for an answer. On the first full moon of January, after his inspiration, he sallies out of his house, runs about, and pretende to bc frantick : but neither injures nor speaks to any one. He approaches the door of his chief, and makes signs to have a cock, and a hen's egg, brought to him: the latter he immediately eats, and wringing off the head of the cock, sucks the reeking blood, and throws away the body; whence he proceeds to unfrequented rivers and jungles, where he remains seven, or nine days, and is supposed to be fed by the Deity, whom he repre-
sents on his return, and when his reason is restored, to have treated him sumptuously; that God had sometimes seated him on a large snake, and, at others, made him put his hand into the mouth of a large tiger; but without fear of any danger. On the Demauno's emerging from his retreat, he brings with him a large plantain-tree, which he had torn up by the roots, and places it on the roof of his house; then returns, and brings in a large seedce-tree; again, brings in a nuckmun-tree; and lastly, a seege-tree; all of which, to the astonishment of the people, he, without human assistance, places, in like manner, on the roof of his house. It is to be understood that these trees are too large for one man to pluck from their roots and carry; and that the seege-tree is full of thoras, which cannot be touched with inpunity; but, by divine aid, he effects these wonders. On the night of his return, he represents, that the Bedo Gossary appears to him in a vision, and desires him to sacrifice a pigeon or a cock to him, with prayers. Accordingly, in the morning, having recovered his senses, he takes some oil to besmear the trees he had deposited on the roof of his house, and some red paint to make streaks on them; over this he scatters some undressed rice, and lastly, sacrifices the pigeon, so that the blood may fall on the trees; and, during this ceremony, he prays.

Henceforward he must never sit with or touch any woman but his wife; should any other woman even touch him by accident, it is supposed
his predictions would fail; or, should he marry more than one wife at a time, the people would have no faith in him. Having thus passed his novitiate, and obtained the reputation of a good Demauno, he is invited by his chief to the buffalo-festival, who puts round his neck a red silk thread, with five cowries strung on it, and binds a turban on his héad, beseeching God that he may have power of restoring health to the sick, exorcising such as are possessed of devils, and that all his predictions may prove true. In this manner he is ordained, and officiates at the festival. A Demauno drinks of the reeking blood of all offerings sacrificed while he is present. He must never eat beef, or dhai, nor drink milk; for, in doing so, his prophecies would fail. There is no fixed number of Dcmaunos for the duty of a village: some have several, while others have none. The Maungy of every village sacrifices a buffalo in either the month of Maug, or Phagun, annually: he fixes a day, and desires his vassals to attend, each of whom contributes a portion of grain, oil, or fpirits for the festival: provisions being collected on the day appointed, the Moungy directs his followers what to do. Some cook, others go and cut a large branch of the muckmun (or sicwia) tree, which is brought, and planted before the Maungy's door, one of whose family carries out the kundone (a sacred stool, with four feet) and places it under the shade of the mucknur-branch, washes it, rubs it with oil, spots it with (sozindra) red paint, and binds it with a thread of red silk; the Maungy, having made his salim
to the stool, sits on it; the Demauno, or priest, sits on' the ground to his left, and prays first; after which he gives the Maungy a handful of unboiled rice, which he scaters close to the muckmuni-branch, addressing himself to God, to protect him and his dependents, and to be propitions to them, adding a vow to perform and hold this festival annually. During the time of praying, the Munligy's drums are beating, that all within bearing, who are possessed of devils, may run, and pick up the rice to eat: having gathered it all, they are scized, bound, and taken to a fmall distance from the altar, when the buffalo, with ropes on all his legs well secured, is hamstrung by the Maungy, to entertain his barbarous followers, in order that they may be diverted by his struggles and exertions, in forcing him to the muckman branch, where his head is cut off; and the persons possessed of devils, who were bound, are set at liberty, and immediately rush forward to take up the buffalo's blood, and lick it while reeking. When they are supposed to have cnough, they are besprinkled with water, which renders them completely cxorcised, and they retire to a stream to bathe: the adherents come forward with their offerings of rice, oil, and spirits, and receive a blessing from their chief, who has the buffalo's head dressed, and cats it with the priests and musicians: the ficndone being taken into the house, puts an end to the ceremony of the day. The next morning the adherents assemble to feast on the buffalo and other things which the Maungy furnishes. At the
expiration of five days a fowl is immolated, and the blood sprinkled on the muckmun-branch, which is taken up, and with the horns and some of the bones of the buffalo, is fasteried on the roof of the Munngy's house, where they are left to decay. -In some places stages are erected for these sacred fragments, at the north-east angle of the Mlaungy's house. The chief Maungy of a tuppah (which is a number of hills that have villages on them) whose authority is acknowledged by the Maungies of the several villages in his limits, appoints a time annually to pray, that they may have rain enough for their crops. This festival may be held in any month in the year, except Poos, in which they neither marry, build a house, nor undertake any thing of consequence, considering it an unlucky month. The chief of the tuppate having determined on a day, sends an arra to the Manngy of each village, desiring him to attend with twenty or thirty of his men by the day fixed on: when assembled, they all repair to the place established without the village, for the ceremony of the Satane: having planted a small branch of the chagulno (bale-tree) the head of a goat is severed with a sword, that the blood may fall on the leaves of the chagulno: the Satane is then resorted to, to ascertain what chief will be most acceptable to the God of Rain, to pray to on this occasion; this being setuled, a day is named for prayer, upon which all the Munngies, with their vassals, assemble at their chief's, before whose door the Domanno and the Maung\%, on whom the Satane election had fallen,
pray: after which a buffalo is sacrificed, and the same forms observed as described in the buffalo-festival: it continues as long as the provisions which were presented by the several Manungies last. The danger of a scarcity is thus supposed to be averted, and that their crops will flourish.
When a Maungy has established a village, should a tiger infest it, or the small-pox, or any plague prove fatal to its inhabitants, it is supposed that Ruxey Gosaif is desirous of having a shrine raised. The Satane is resorted to, to confirm the supposition, and the Demauno consulted. On both agreeing, these steps are sufficient to stop the ravages of any beast of prey, and to avert any further fatality from the small-pox. Thus relieved, the Maungy calls the Demazno to get ruxey (a sacred black stone) for him ; in compliance with which the Dimanno has a vision, in which the Deity appears to him, and informs him where the god Ruxey is to be found, directs him to the spor, and desires him to raise him with his own hands, and to present him to the Maungy in the morning. The Demazno gets a branch of the seedee (a tree peculiar to the hills); benjamins is burned before the Maunzy's door, which he smells, and proceeds, followed by some men to the spor where Ruxex is to be found; having smelt the godhead, he directs the persons who were in attendance to dig for him ; to facilitate their work, water is thrown, to soften the earth; and when Ruxey is discovered, the Demamo takes him up, and carries him to the Maungy, who immediately
sets out, with his divine present, in search of a large tree, about half a mile, or less, from the village, under the shade of which he places it, and encloses it by a fence of stones, and a hedge of seege: a fowl and a goat are sacrificed to the god, whom the Maungy, or some other'acceptable person (and it is the object of the Satane to find out who is most virtuous and most worthy to address the god) worships and retires.

At any other time when this god is worshipped, a fowl and goat are sacrificed; and the Maungy, or person who prays, is attended by two drummers and an old man, who has no wife, and, from age, has no connexion with women, to partake of the offerings wish the preacher; of which others, who lave forsworn all connexion with women and drinking intoxicating liquors, may share. Whoever violates this vow by drinking or cohabiting with women, it is believed will become foolish; yet he may recover his reason by asking pardon of the god, and by offering a fowl and goat, with prayer in sacrifice at the shrine; but he can never be a Hook Moko, or an elect eater, again.

Id le men and women must not approach or profane the place were Ruxer is deposited, by spitting towards him, or by doing any uncleanly act near it: should any person, through forgetfulness, or ignorance, be guilty of any such acts, by spitting, he will get a sore mouth; and other more offensive trangressions are productive of a strangury, or flux, respective'y; and these diseases are often considered
as the effects of some heedless transgression of the above nature, which is discovered by the Satane, or such like proof: their remedy is to give a fowl to the Maungy, who makes an offering of it to the god, who is thus appeased. If the patient recovers, well; if not, the friends go to a neighbouring village, to find out, by the Satane, the cause of their relation's illness: if he is not thus relieved, they go to a second; and, on failing, they consider it as an affliction by the dispensation of the Supreme Being, who will either spare, shorten, or prolong the life of the offending patient, according to his will.

The Chitaria-festival is held but once in three years. The celebration of it so seldom is, probably, from its being very expensive to the Manngy, who bears the charge. It is not every village that has a Chatuait, though he is considered as the God that presides over the welfare of villages; but, like Ruxey Nad, he is not supposed to be essential to their happiness till the inhabitants are harrassed by some plague or pestilence; when the Demauno, on being consulted, informs the Munursy that this Deity is desirous of having a Nad raised; that effecting this, and worshipping him, will put an end to their misfortunes. The Demauno then dreams of the place where this shrine is to be found, in the shape of a black stone; he proceeds in the morning to discover it, observing the same forms as are described in obtaining Ruxey Nad; when found, the stone is placed under the shade of a mucknnun-tree contiguous
to the village, and undergoes no alteration in its form from the chissel.

Among the preparations for the Chitaria-festival, the Muungy must provide a cow and a piece of red silk, previous to the day fixed for prayer. The Satane, as usual, is performed, to find out what two of the Maungy's vassals will be most acceptable to the godhead, to pray. This point being settled, and every thing ready, a day is fixed: on the eve of this holiday, the piece of silk is cut in two, and one part given to one of the wives of each of the preachers, with whom their husbands have not cohabited for ten or fifteen days previously. The Demauno. Maungy, Cutival, Phojedar, Jemmadars, and Bundureens, having been invited into one of the preachers housees, the Demazno gives water to two Kalewars, one Doleevar, one Mangeera, and one Jelaun, to wash their hands; and these musicians are taken into the house : a feast is served, of which all present partake, as soon as the chiefs have thrown a litule of each dish away, in the name of Chalniad. I must here digrees, to observe, that it is a custom through all the hills, to throw a little of their meat away at every meal, previous to their eating; and the same rule is observed in drinking; the intention of which is, to avert any bad consequence from any devil or evil spicit having defiled ii. The Bandareens, whose particular province it is at all festivals to serve out the todily, or spirits, perform that office; and the cliiefs, having spilled a little also in the name of Chaliad for a libation, the party drink and sing Yol. IV.

E
all
all night, in praise of Chitariah Gosaif, invoking his protection, the musicians, or rather drummers, beating at the same time. Should any person sing a different song, he is fined a fowl, which is sacrificed, and the blood sprinkled over the whole party. During the course of the night, they patrole the village five times, leading a cow with them; in the morning, the Demazno, the two preachers and drummers, proceed to Chalizad with the cow. Having finished their prayers, the cow is sacrificed by one of the preachers, in such a manner that the blood may fall on the shrine: a feast is immediately made of the flesh, and all the men who accompanied them from the village, except such as may be disqualified from domestic causes, partake of it. On their return to the village, they send notice of their approach, that the two wives of the preachers, between whom the piece of silk was divided, may take off their clothes and ornaments, and tie the silk round their middles, covering them from their waists to their knees: their hair is fastened in a knot on the crown of their heads; and every part of their body which is exposed, is spotted with a mixture made of turmeric, powdered, and the heart, or white part, of Indian corn, which is fincly ground for that purpose : part of this is also sent to the preachers, that they may be spotted in the same manner, and with it the halves of four mats thus prepared. The two women (the whole willage, men, wonmen, and children being assembled to see the procession) set out, one following the other, and taking care not to ad-
vance the foot which is up beyond the toe of that on the ground, to meet the preachers, who observe the same pace as their wives; and the mats, as the parties pass over them, are always taken up and placed again before. Having passed each other, the women take place behind the men, and follow them by the same step at which they at first set out, to the house of one of the preachers: when arrived, the men taking one side, and the women the other, they wash and change their clothes. Here the ceremony ends; and the preachers, with their wives, are invited to a feast at the Maungy's.

The above is the only festival where women can assist, or bear any part, as a woman never prays in public on these hills. It has before been said, that they are to recommend themselves to the protection of the Supreme Being, morning and night. During the time of the above festival, the compliment of a salam: is not paid to any person.

Pow Gosaif, or the God of the Road, or Highway, is the first worship young men perform; though it is not undertaken till some accident has induced the person to consult the Cherreen, or Satane, whether his praying and making an offering will be acceptable. This trial is perhaps of itself sufficient to confirm the opinion, that Pow Gosaif is offended; therefore the young suppliant vows to worship him. On the day of thanksgiving, on which the new Takalloo is first eaten of, or on the day appointed for the new Kostrane-harvest, he proceeds to a high road, and cleans and washes a small space under
the shade of a young bale-tree : in the centre of this he plants a branch of the muckmun-tree; round it he makes marks and spots with red paint, and with a handful of rice, which he lays close to the branch, placing a hen's egg on it, on which three streaks of red paint were drawn, he invokes the Supreme Being, and God of the Road, to protect him while travelling, and sacrifices a cock, the blood of which is thrown on the muckmur-branch: the offering, being dressed with rice, is eaten by the suppliant and such as may have attended him. The ceremony ends by breaking the hen's egg ; and is never repeated by him unless he should again meet with some accident while travelling; on which the Cherreen, or Satane, is resorted to, for a confirmation of the apprehension that it was caused by Pow Gosain's resentment, and his desire of being worshipped.

Dewary Gosaif, or the God who is supposed to preside over the welfare of families, is the second worship which men perform : there is no fixed time for it. He who discovers by the Cherreen, or Satane, that the welfare of himself and family depends on his holding this festival, distils spirits, purchases a hog, rice, red paint, and oil; and, having fixed on a day, invites his Mluungy and fruends on the day appointed: a small space before the threshold is brushed and washed, and a branch of the muckmun planted in it : on this some red paint is put, as well as marks made round it. The Munurg and his officers are taken into the suppliant's house, when pots of spirits and provisions are given to the former,
as well as meat and drink to all the company. After a short repast, the suppliant, with a hen's egg and a handful of rice, approaches the muckmun-branch, close to which the former is deposited on the latter. During this ceremony, he implores the Supreme Being and Dewary Gosaif, to be propitious to him and family. The hog is sacrificed by a relation, as an offering to Dewary Gosain, with professions of again observing the festival whenever Dewary Gosaify may desire it. A feast is made with the oblation; and, at the conclusion, the suppliant breaks the egg, and pulls up the muckmun-branch, which he plares on the roof of his house.

Kull Gosaif, or the Ceres of the mountaineers, is worshipped annually by cultivators, in the season of sowing their fields: the proper time is ascertained by consulting the Demauno, and confirmed by either the Cherreen, or Satane; and is attended with more or less expence, according to the means of the suppliant. If poor, it is deemed sufficient to make an offering of a cock; those who can offord it, purchase a cut hog and a cut goat, distil spirits, buy rice, red paint, and oil, and invite the Demazno to assist them in praying, as well as their friends, chiefs, and neighbours, to a feast, On the day appointed, the Demauno goes early to aid in distilling spirits, and in other preparations for the feast: the chiefs and others, having entered the suppliant's house, are presented with meat, and spirituous liquors to drink: the Demauno is also introduced with two Kalewars, and one Dolewar: : he, and the suppliant, and the

Manngy, facing the middle supporter of the house, pray for the welfare of the master, making a libation, and throwing down some meat, in the name of Goомо Gosaif, and of Kull Gosaif: the Demanno and suppliant burn incense, while the Kalewars and Doleroar beat, and the Marngy and chiefs eat and drink. After this, the suppliant proceeds, with the Demauno, musicians, and all who may be disposed to join in the procession, to his field, where, at the stump of a tree, having cleaned a smail space, and planted a branch of the muckmun, and prayed with the forms already described, burning incense, -the goat and hog are sacrificed by a relation of the suppliant's (who gets a rupee and a turban for this sacred office) so thint some of the blood may fall on the muckmun-branch, and of which the Demauno pretends to drink a considerable quantity. He gives out that the blood digests in his throat, and does not pass into his stomach.

Of each of these offerings, the Maungy is presented with a fore-quarter for his family; and of the remainder all, except such whose wives are in their separation, partakc. At the conclusion, the Demauno gives water to the musicians and the suppliant, to wash their hands, who return with the latter, and feast and drink at his house as long as any fragment of the provisions which had been prepared for the festival remains.

The Demauno having desired any person to worship Goomo Gosanfi, and the Cherreen, or Satane, baving confirmed his ordinance, the suppliant must
rear a cut kid and cut pig for that express purpose, about two years, more or less. Having acquired property enough to perform this promise, for it is attended with considerable expence, he sends invitations to his chief and vassals, to those also in the neighbourhood, and to his relations; and, to mark the time for the festival, a string, with a number of knots equal to the number of days that will intervene, is sent to each. From these strings, to avert mistakes, one knot is daily cut: in the interval the suppliant is employed in distilling spirits and collecting materials, such as rice, oil, red paint, \&c. when one knot remains, the guests assemble, and, on the morning of the day appointed, some of the suppliant's neighbours, or relations, proceed to the jungles to cut three small muckmaun-trees. Before the first is hewn, a cock is sacrificed, that the blood may fall on it, and some spirits thrown on it, as a libation to Goomo. As soon as the branches and bark are stripped off, two men are sufficient to carry each tree, and lay them without the village, where it is their business to prevent men, goats, or fowls, from touching them; and the suppliant, informed of their arrival, sends them drink for their trouble. In the mean time he takes the chiefs and their officers, with the two men who had prayed at the Chittariafestival, into his house, and presents the Maungy with two pots of spirits and a hog : the Demazmo, two Falewars, and a Dolewar also go in. At their entrance, the Demauno gives water to the musicians, to wash their hands; he takes a small wicker-basker,

$$
E_{4}
$$

con-
containing about a seer of rice, on which he puts red paint, and places it with two pans near the middle supporter. During this the Kalewars and Dolewar beat, and incense is burning; the Maungy having made a libation, thrown out some meat, and sacrificed the hog, in the name of their gods, he and the chiefs eat and drink.

The Demauno, suppliant, and musicians, repair to where the trees are; whence the trees are brought home, laid lengthwise, east and west, cut the proper length, and the suppliant and his wife sprinkle zurmeric-water on them: the Demauno, mounting astride on the one which had been first cut, is carried five times round the house, when they are taken in, and, some earth being dug, are united to the middle supporter (which is called Goomo) being first spotted, with red paint, and bound with a red silk thread. Incense is burned; and the Demanno, with a handful of rice, prays, laying the rice down, and placing a hen's egg on it, which had becn previously thrice streaked with red paint: the suppliant, receiving a handful of rice from the Domanno, also prays, throwing it on the egg, when one of his relations brings up the fat goat, and sacrifices it so that the blood may fall on the Goomo. For this sacred office he gets a rupee and a turban. The Demauno, suppliant, and musicians, and all who may be dis: posed to be of the procession, proceed to a fielc, where, sweeping and washing near the stump of a rrec, they plant the branch of a muckmun, and round it and on it make streaks of red paint : incense is then burned,
burned, and with a handful of rice and a hen's egg, the Denuunno and suppliant repeat the prayers and ceremony which had been observed in the house, when the fat hog and another goat are sacrificed by a relation. Some of the blood of these animals must fall on the muckmun, and the Demauno drinks of it.

A fore quarter of each of the offerings being sent to the Minungy, they feast and return: previous to entering the suppliant's house, the Demauno gives him and the musicians water to wash their hands. The relations of the suppliant attend him, present him with spirits and a cock each, and anoint him, his wives, and children with nil: he sacrifices the cocks, makes a libation, and throws away some meat in the name of Goomo: they feast and drink for two or three days, and then repair to their homes. On the fifth day the ceremony concludes, by the suppliant sacrificing a cock to Goomo Gosaif, and another to Kull Gosaif.

Goomo Gosaili is also worshipped as above, with this difference, that the suppliant does not eat, drink, or smoke in his house, or partake of any thing that had been in his house, for several days before the festival; nor is he allowed to partake of the offerings : and this prohibition continues for five days after the festival, which is calledi Oogoss Goomo Gosaif.

The worship of Chumdah Gosaif is so expensive, that none but chiefs, or men of property, can ever afford it, and these not oftener than once in three years; and therefore the votaries to this shrine
shrine most frequently exceed that period for so expensive a ceremony. They first consult the $D e-$ mauns, and have recourse to the Cherreen and Satane; both of which must agree with what the Demauno prescribes, before this festival can be held: when thus ordained, the suppliant must provide about a dozen hogs, as many goats, about three score seers of rice, two of red paint, fifteen of oil; about twelve rupees must be expended in spirits, and some scores of cooking pots, dishes, and cups for drinking, laid in, as well as a few peacock's tails, a fan, three bamboos, nine score natâria-trees, and some red stones, which are ground for paint, and also some charcoal. Thus prepared, the suppliant sends strings, with knots numbering the intervening days, with invitations to his relations and neighbouring chiefs. On the day appointed, some thousands assemble, and are variously employed. Somie grind the red stone for paint, others charcoal to mix with oil, while a great number are occupied in stripping the baik: off the nataria, which is effected in one piece of four cubits long, by bruising it ; three hamboos are then made straight by oil and fire, aad are of the same length with the naliuricu-bark; a fat hog, grain, and several pots of spirits, are sent to the workers. The red stone and charcoal being ground, are mixed separately with oil, and a quantity of hog's blood added to both: the barks of the natâria have about a cubit of the lower end of each tiackened with the charcoal, another cubit is left of the naiural colour, and above it one cubit is painted red;
caps of wood are fitted on the bamboos, and necks made in them : on one of these, four score and an half of barks are bound with twine dipped in oil; on the second, three score are bound, and on the third, one score and a half; the heads of these three are ornamented with a profusion of peacock's tail feathers, thus prepared; they are called Chumpaif Gosaif, and carried to the suppliant's house, where for the workmen a hog is dressed with grain, that they may be feasted for their trouble: a hog, two pots of spirits, grain, and salt, are presented to every chief, for himself and vassals, who honours the suppliant with his company; as much is also given to his own relations, and a like quantity to the relations of his wives, and meat and drink is distributed to all assembled. The women, who dress these provisions, exclusive of their daily hire, have a hog given to them, that they may eat together, as they are not allowed to feast with the men.

The Chumidalh-bamboos having been brought about evening, and placed against the suppliant's house, he and the Demanno rub the ends on the ground with oil, and mark them with red paint; when the latter, with a hen's egg and a handful of rice, prays, observing the usual ceremony, that Chumdah Gosaif may be propitious to the suppliant, who follows his example, and also makes an offering of a cut hog, which he sacrifices so that the blood may fall on the bamboos; the largest of which, or one with the greatest number of barks pendant to it, he presents to one of his relations ; the second in size to one of his wives
relations; and the third to any volunteer. The three persons thus favoured, support the Chumdahs by cloth tied round their waists, and balance them with their hands, dancing as long as they can : when fatigued, they are relieved indiscriminately, without any distinction; and this amusement, with music, continues all night. In the morning the Demazno and suppliant pray at the middle supporter of the latter's honse, with the usual forms, when a cut goat is brought as an offering, and sacrificed by a relation: hence they repair to his field, taking with them the Crinmdah, and again pray near the stump of a tree, where a small space is brushed and washed for the purpose, and a branch of the muckmun planted, in addition to the egg and rice deposited there by the Demeuno and suppliant: a shrine for Kull Gosain is washed, rubbed with oil, red paint put on it, and bound with a red silk thread, and placed close to the muckmum-branch, when a goat and two hogs are sacrificed by a relation, that the blood may fall or be sprinkled on the shrine Chumdah and branch. For this office he gets a rupee and a turban: the offerings being dressed, are eaten with grain : the party having feasted, return, bringing with them the Chumdullis, which are carried five times round the suppliant's house, and then placed against eares, where they remain five days; at the expiration of which, a seer of takallone is served out to every person who applies for it, at the suppliant's house ; but fow men are s'ationed at each of the four doors, that every person who goes out with the takallone, may receive a blow
with the open hand from each of the four men stationed at the door he passes out of. At the conclusion of this ceremony the Bhumdah-bamboos are taken into the house, and suspended to the roof; the suppliant repairs to the field, and makes an offering of a hog, and prays at the shrine of Kull Gosain, whence he returns and sacrifices a goat at the middle supporter of his house, with prayer: these offerings are dressed, and, as is customary, they feast on them.

Whes the kosarane (a small grain like what the lowlanders call collye) is reaping in Nosember, or the beginning of December, a festival is held as a thanksgiving before the new grain is eaten of. Materials for a feast being prepared, a day is fixed by the Murng.r, who invites the chiefs of the neighbouring villages. On the day appointed, the two men who prayed at the Chilaria-festival, proceed to Chaluad to pray, and sacrifice a goar, which, with some kosarane, is an offering at the Nad to Chitariah Gosaif. On their return to, the village, the Muntrgy has his kondone brought out, on which he prays and immolates a fowl. During this, the dumgareahar, or vassals, repair to their fields, offer thanksgiving, make an oblation to Kule Gosaiti, and return to their houses to eat of the new kosuritue. As soon as the inhabitants assemble at the Maungy's house, the men sitting on one side, and the women on the other, the Phujedar presents a hog, a measure of kosarane, and a pot of spirits, to the Manngy, in the name of his vassals, by whom these had been contributed. On receiving them, he blesses his vassals, and exhorts
them to industry and good behaviour ; after which, making a libation in the names of all their gods, and of their dead, he drinks, and also throws a little of the kosarane away, repeating the same pious exclamations; which ceremony is the commencement of the festivity and drinking that lasts for several days.

On reaping the takallone (Indian corn) in August or September, there is also a festival. Each man repairs to his field, with either a hog, goar, or fowl, to sacrifice to Kull Gosain, to whom he prays; and, having feasted, returns home, where another repast is prepared; and on this day it is customary for every family in the village to distribute a little of what they have prepared for their teast to every house.

Should any person eat of new kosarane or takallone before the festival and public thanksgiving at the reaping of these crops, the Maungy fines the offenders a cock; which is sacrificed by the two preachers at the shrine of Chittâriulh.

The mountaineers are represented to have in general an amorous disposition; their solicitude and attentions, when in love, are said to be unceasing. If separated but for an hour, the lovers are miserable; they conceal their meat to present to each other privately. The lady dresses whatever nice things she can secrete from her parents, to treat her lover with; and he presents her with rings and beads, and treats her with toddy. They go to market, and exchange paun and tobacco; and, on their return, should they perceive an acquaintance, they separate, to avoid being seen in company; but by
assignation soon meet again. They retire to sleep together, but seldom are guilty of that indiscretion which is irreparable, though the fine for such imprudent conduct, which the parties are afraid to conceal, is a hog and a goat to the Maungy, who sacrifices them on the spot where frailty made them transgress, and sprinkles some of the blood on them, to wash out the stain from his land, or rather to appease an incensed deity, who fails not to punish for such abominations. Thus when a virgin is deflowered with her consent, the blood of the offering is supposed to atone for their $\sin$. Should the couple agree to come together as man and wife, the Maungy proclaims it; and they are immediately considered to be married, without any further ceremony or expence. The man has the option of taking her for his wifc: she however has the privilege of demanding a regular marriage, which implies the usual presents, and the time for the wedding is fixed.

Polygamy is allowed. A man may marry as many wives as his circumstances will admit of ; that is, as often as he can defray the expences of the nuptials. When he sees a girl whom he wishes to espouse, he sends a friend to her parents to ask her in marriage : they refer him to the lady. Should he obtain her consent, he acquaints the parents, who desire him to return to the suitor, to advise him of their acquiescence, and that he may prepare the usual presents of poonate (beads) and tubacane (a ring for the neck) to present to the lady; which being ascepted, she is considered betrothed to him; and
he, as soon as he can procure money for the exs pence of the nuptials, must provide a turban for the lady's father, with one rupee; also a rupee and a piece of cloth for her mother; and a rupee and a piece of cloth for several of the nearest relations, These and the materials for the marriage-feast being provided, a day is fixed, on which the bridegroom, with his relations, proceed to the bride's father's house, where they are seated on cots and mats, and after a repast, the bride's father taking his daughter's hand, and giving it to the bridegroom, be publicly admonishes him to use her well and kindly, and not to murder her; threatening to retaliate; but if she should die a natural death, or by means of the devil, it cannot be helped. On the conclusion of this exhortation, the bridegroom, with the little finger of his right hand, marks the bride's forehead with red paint, and the same little finger being linked with the little finger of the bride's right hand, he leads her out of the house to his own. At the expiration of five days, the bridegroom, with the bride, returns to her father's, well stocked with provisions for feasting, and, having passed two or three days with their parents, they go home, and the ceremony concludes.

A man dying and leaving widows, his younger brothers, or younger cousins of the first and second degrees, or nephews, may receive the widows as wives. If the parties agree on these occasions, the children go with their mother: if the widow prefers returning to her relations, the children under ter years of age go with ber, and she is entitled to a
rupee and a piece of cloth annually, for bringing them up. When arrived at that period of life, they are sent to the relation of their father who paid their mother for taking care of them. When a woman has ten children, her eldest brother may claim one ; the right is acknowledged from custom, though it cannot be enforced. The child thus adopted by an uncie, is treated as and has every privilege of his own children. Should this son by adoption arrive at manhood, die, and leave property, it is equally divided between the adopter and the father of the deceased.

A man desirous of marrying a widow, deputes a friend to ask her in marriage. Should she consent, she refers him to her late husband's relations, the nearest of whom, for his acquiescence, is entitled to two rupees and a turban. The parenis of the widow are next consulted. Should they approve, they are entitled to some trifling presents, on which the father gives his daughter's hand, exhorting the bridegroom, as related in the description of a marriage. The red paint is not used on a second marriage: i feast concludes the whole.

A man cannot marry a relation, though he may matry his wife's sisters, except in the instance of younger brothers, cousins, and nephews, receiving one each, or more, of their senior kinsman's widows, who are treated and considered as wives, though there is no expence nor ceremony attending theit imion.

Vol. IV.
F
SHOULD

Should a girl be compelled by her parents to marry a man whom she dislikes, and should she be unhappy, and leave her husband, and, in despair put an end to herself, the parents get a court appointed, to enquire how their son-in-law behaved to their daughter. If it should appear that he treated her cruelly, he is considered guilty of murder, and fined, but not so heavily as is common for the commutation of blood. If, on the contrary, it ṣhould appear that he behaved well to her, it is deemed suicide.

Should a married woman elope with a man, and the party be pursued, seized, and brought back, judges are appointed to try the man; who is generally fined one or two score of rupees. The husband may or may not receive his wife, and the seducer has to pay the fine.

A MAN convicted of having committed adultery, is fined twenty or thirty rupees: he is also obliged to furnish a hog, the blood of which, being sprinkled on the adulterer and admiteress, washes away their $\sin$, and, it is believed, will avert divine vengeance : the ceremony ends with a feast, and, the parties thus purified, the husband and friends are reconciled. The adulteress in general reveals the secret; as a superstitious idea is entertained, that, if concealed, the inhabitants of the village will be visited by a plague, or that a tiger or venomous animal will destroy them. When any of these happens, it is religiously believed to proceed from the immorality and evil doings of somie individual, and as a punishment for some concealed sin ; to discover which they
have practices, in which they place implicit faith: one is called Satane, and is as follows:-A place large enough for a man to sit in, is brushed and washed, in the middle of which a small branch of the bale-tree is planted, and a person sits opposite to it ; another supplies him with a few grains of rice, on a Bale-leaf, some of which he throws on the branch, the remainder he is to eat ; the person who gave it to him repeating, that he is to swallow it in the names of all the inhabitants of the village ; in which should the sinner be, it is believed God will make him throw up the rice. Should this happen, he is next to eat some in the names of families, and again in the name of all the individuals who compose that on which the Satane proof falls. Another is called Cherreen, and is thus:-A stone is suspended to a string, which, it is believed, will be tossed to and fro, on the name of the village, family, and offender. The third is called Gobereen, and is of a more serious nature than the two former. A pot with some cow-dung, oil, and water, is put on the fire; when boiling, a ring is thrown in; each person approaches to take cut the ring, calling on God to protect him if innocent, and to burn him if guilty. On this trial, it is believed, the innocent will escape unhurt in taking out the ring, and that the guilty person will be severely burned, without being able to put his hand into the pot, as the mixture, it is said, will boil up to meet his hand.

When a married man has been detected in committing fornication, his wife or wives may insist on a
hog or goat being sacrificed, to sprinkle the blood over him. Being thus purified, it is believed this ceremony expiates divine vengeance, which would sooner or later alight on him or some of his family, for this sin.

Witcheraft and sorcery are most firmly believed; and accidents or diseases, which elude their little skill in medicine, are attributed to some person supposed to be skilled in these arts, who has bewitched them. When such a conviction is admitted, the Cherreen is consulted, and again the Satane, both repeatedly, till some person be named. To confirm this ideal proof, which is received as infallible, an ordeal is undertaken; and on the part of such person (supposed to be bewitched) five men are employed who are qualified and acquainted with this mode of trial. Such as are born immaturely cannot be engaged in it. These five proceed to a retired place on the banks of a river, before day-light, taking with them wood of a particular kind, and make a fire to heat an iron: one of these is to touch the iron when red hot with his tongue, but is first to bathe. While he is performing his ablution, the others heat the iron : when red hot, a little rice is thrown on it, in the name of the person accused of witchcraft, and BirmaE, the God of Fire, exhorted to do justice. If it consumes, he is considered guilty; if not, not : The Taitoo, or person who touches the iron, keeping one foot in the water, puts the iron to his songue, and must repeat it as often as nine times, if the first and second, touch does not burn; which however cannot.
happen.
happen. Ori the Tâtoo being burned, the party return before sun rise ; and, on their approach to their village, the friends of the sick person are called out to see the Táton's tongue. The person accused may object to the trial, and insist on its being held over again, that two persons may go, on his part, to witness it. On this proof, the unfortunate person is seized and punished, till he or she acknowledges the crime. It must be also told who instructed him, or her, in the practice of this evil art. The Chouraga, or warlock, is now brought to the sick person, to exorcise him from his spell. Should he recover, the Chouraga is compelled to pay one rupee to him, one to the Maungy of the village, one to the four persons who witnessed the ordeal, and eight annas to the Tátoo. On the other hand, should he die, the Chouraga must either suffer death, or redeem his life (at the option of the friends of the deceased) at the price established tor the commutation of blood. Again, the friends of the Chouraga may retaliate on the person whom their relation accused of having instructed him in sorcery.

Ir is not uncommon for two neighbours to agree, when their respective wives are pregiant, that the offspring, in the event of there being a boy and a girl, shall be married to each other. On these occasions, the ceremony may be performed when the parties are about eight or ten years old. Should the father of the girl violate the engagernent, and give his daughter to another person, the father of the boy will obtain a fine equal to the expence of a
marriage, which is rated according to their circumstances: whereas, should the father of the boy, notwithstanding his contract, marry his son before he has performed his part, the father of the girl is entitled to a fine of a turban and one rupee: after which it may still be performed or not, as the parties mutually agree.

When a woman is in labour, four or five of her relations and neighbours assemble to attend her; amongst these, the most experienced does the duty of a midwife. The woman keeps her house for five days, and her husband attends her ; during which he must not enter any person's house, or field, nor until he and his wife have washed their clothes and bathed. On this day the child is named by the father; but, if he be not present, the mother gives a name; however, this name may be changed before the child is weaned. After this they go out as usual. The women who attended her in child bed are entitled to a feast, are anointed with oil, and their foreheads painted red. A piece of cloth is given to the one who performed the office of a midwife; and a little grain, or some other trifling acknowledgement, to the others for their friendly assistance.

Whex a child dies that is not weaned, the father sends a friend to his Maungy, to solicit ground to bury the body; which being complied with, the corpse is carried to the grave, in a place allotted for public burial, and interred with its head to the north. For infants of this description, no further ceremony is observed; but, when a child dies that has been weaned,
weaned, at the expiration of five days; the relations and neighbours are invited to a feast called Boge, which being prepared, the father, or nearest male relation, takes a little of every thing that may be dressed, and proceeds to the road leading to the bu-rying-ground, where he throws them away, in the name of GoD and the deceased; the intention of which is to avert the like misfortune in future ; and, returning to his house, the company are feasted, all observing the same custom of throwing away a little, in the name of God and the deceased, previous to eating. Another entertainment, similar to this, is given at the expiration of a year, and, annually, at the thanksgiving for reaping the takalloo and kosarane. Some of each of these grains are thrown away, in the name of God and of the deceased.

When a child is still-born, the body is put into an earthen pot by the women who attend, and co. vered with leaves; the father carries the pot into the jungles, places it near the stem of a tree, and covers it with some brush-wood, where he leaves it; and there is no further ceremony.

The corpse of a person dying of the small-pox or measles, is taken with the bed-stead into a jungle about a mile from the village, and placed under the shade of a tree, where the body, the bed-stead, and clothes, are covered with leaves and branches, and left. Those who attend the funeral, bathe before they return to their homes. At the expiration of a year, the relations, being prepared for a festival, proceed out of the village on the road leading to
where the body was placed, with all whom they invite; where one of the kinsmen having prayed, and thrown away a small portion of the feast, and made a libation in the name of the deceased, the party assembled partake of it, and return. The bodies of most others, dying a natural death, are buried; and the cause assigned for disposing of the bodies of those who die of the small-pox, as described above, is a superstitious idea, that such an act will avert any further fatality; whereas, if buried, it will continue to rage, and carry off every irhabitant of the village; which is reported to have happened formerly.

When a young man, or virgin, who is marriageable, dies, the father, or nearest relation, sends a friend to solicit four cubits of ground, to bury the deceased, from the Maungy; who asks if the relations propose putting the bed-stead into the grave with the body; in which case a rupee is paid to him for the purchase of a hog. No time is lost in carrying the body to the burying-ground, where a grave of a foot and a half, or two feet deep, being dug north and south, the head is placed towards the former point; the body is covered with pieces of green wood laid across it; after this some long grass, and then the earth which had been taken out, is thrown over the grass : to conclude, small stones are laid to encompass the grave, and a few over the middle of the body. No women or girls are ailowed to go to funetals, nor: are prayers said. On the return of the
party, it is customary for the whole to wash their legs and arms previous to entering their houses.

The hog which the Maungy had purchased with the rupee that was paid for permission to deposit the bed-stead with the corpse, is sacrificed by him. The liver being taken out and roasted, the Maungy takes a small bit, and casting it away with some of the blood, in the name of GoD and of the deceased, the remainder is divided among such men as may be present, who repeat what the Maungy had said, throwing a little away before they eat. After this repast, the carcase is divided; the Muungy separating a fore-quarter for his family, shares on the remainder in proportion with every inhabitant of the village. At the expiration of five days the Boge is observed; and every family in the village, or as many as the relations can entertain, are invited. When the father has performed the ceremony of carrying a little of every thing that is dressed, with some spirits, provided solely for the purpose of a libation, to the road leading to the burying-ground, and there cast them away in the name of God and of the deceased, the company assembled are all served, whether male or female, old or young, on separate leaves; and each, previous to cating, observes the ceremony of throwing some away, 'as already related. Another Boge is held at the expiration of a year, differing only from the former in the free use of liquors. At the annual thanksgiving for the reaping of the takal and kosar, some of each is thrown away, in the names of the deceased kinsmen, for one or more
years, according to the degree of propinquity and estimation in which each was held: it however ceases at any time that the survivors remove from the village in which their kinsmen died.

When a chief of opulence and high rank is dangerously ill, he orders his relations, male or female, and vassals, to be assembled; as soon as they attend him, he informs them of his situation; and, as they will observe he has not long to live, he desires them not to grieve, but to be comforted, and points out the son whom he wills to be his successor. Here primogeniture has no preference: if he be a son, he must succeed *, a daughter cannot; though an idiot, it is to be understood his right; and some near kinsman is named by the dying man to be his son's guardian: to him he bequeaths his territories and fortune (though certain sums or parts are to he distributed) and desires them to look to him for protection. On his death a drum is beat, to announce it to such as are at a distance, that they may attend to see the body; which is not removed before the vassals collect together, to be witnesses of the fact; it is then carried without the village, close to which it is interred on the bed-stead, in the same manner as related of a young man's or virgin's funcral. A piece of silk is spread over the grave, and stones placed so as to prevent the wind blowing it off: a hut is erected to shelter it, and, round the whole, a fence

[^6]of bamboos of stones. The mourners, on their return, observe the usual oblation, and are feasted ; but throw away some of whatever they have to eat or drink, in the name of God and of the deceased, previous to tasting it. All who come are thus treated in succession for five days, when the first Boge is kept; when the only difference between it and that of a Dungarria, or cassal, is the greater expence from a concourse of relations and adherents assembling, and that spirits are provided for them. At the festivals for reaping the taked and kosar, some of each is thrown away on the road leading to the grave, as already described. At the expiration of a year, the chief's relations and vassals being invited for their second Boge, the Demanno and the heir pray at his door for the deceased, when all assembled partake of the feast, with the usual ceremony: at the conclusion of this the fortune and goods of the deceased are divided; the heir taking one half, the other is equally divided among the sons, brothers, and nephews by the brother's side. Nephews by sisters do not share ; the widows may, if the parties agree, or go with any of their late husband's younger brothers, or nephews by the brother's side, as wives. If however the parties do not agree to come together, the mothier of the heir has the option of remaining with her son, or of returning to her relations; the other widows must do the latter.

When a married woman dies, the widower observes the usual Boge at the two stated periods: he is not allowed to marry before the performance of the second, or at the expiration of a year ; and it is customary to present the nearest kimsman of his de-
ceased wife with one rupee and a turban, atter which he may espouse as many wives as he pleases, or has fortune to maintain.

The body of a person who dies of a drapsy (Narat) is carried and thrown into a river; if buried, it is apprehended the same disorder would return, and infeet and carry off the other inhabitants. The funeral party having cast the body into the water, proceed to another part of the river to bathe, and there, having brought a fowl and some takál, or rice, some of each is thrown into the water, in the name of GOD and of the deceased, by all who are present, before they eat. This is the only Boge which is observed for persons dying of a dropsy, though, at the thanksgiving, for reaping the Takalloo or Kosar, some of each is thrown away in their names.

When a person has been killed by a tiger, the body or any part of it that is found, is covered with the branches of trees. On the fifth day the relations of the deceased, with a large party, proceed to the place where the remains of their kinsman lay, taking with them a new earthen vessel, a goat, and ten or fifteen seers of Takál, or rice. Being arrived at the spot, one of the nearest relations prays for the deceased, in which he is accompanied by the Demauno; at the end of their prayers, the former scatters some grains of rice, and curs off the head of the goat, naming God and the deceased. The moment he severs the head, he rushes into the midst of the party, who surround him ; the Demauno at the same time seizes the head of the goat, sucks the reeking
reeking blood, and is supposed to become frantic: he casts the head from him and springs after it, endeavouring to imitate the tiger, and making a hideous noise as like that beast as he can : he looks about for the preacher, whom it is the business of the party to conceal, and prevent his touching. Should he in his exertions accomplish this, a superstitious opinion is entertained that the poor preacher will infallibly fall a sacrifice to a tiger. When the Demauno is well wearied by his pranks, the head of the goat is put under ground in the earthen vessel; this speedily restores his reason, and the preacher comes out in safery. The party thence retire to a smali distance, have a feast, and return to their homes. At the expiration of a year, the second Boge is held for the deceased, in the same mannier as for any other relation, and the same attention is paid to his memory on: reaping the Takalloo and Kosar.

When any person dies of the Moogrin, or Kory, a disease in which the extremities decay and drop off, the body is buried with the usual ceremony, and the Boge is twice observed as usual, at which every sort of flesh, except goats, may be eaten: fish is also, forbidden. In that disease goats flesh and fish are not allowed to the patient, which is the cause of their being forbidden at the Boge.

Such as die of an epilepsy, are buried with the usual ceremonies: at their Boge hogs flesh is forbidden, because those who are sutyject to the epilepsy are not allowed to eat it.

Persons who are killed, and suicides, are buried with the usual ceremony above recited.

When a Demmono dies, his body is carried into the jungles and placed under the shade of a tree, where it is covered with leaves and branches, and left on the bead-stead on which he died. The objection to interring his remains is a superstitious idea, that he becomes a devil, and that, if buried, he would return and destroy the inhabitants of the village; whereas, by placing the body under a tree, he is thus compelled to play the devil in some other. The usual Boge ceremonies are obferved, but cow's flesh forbidden to be eaten at chem. Should a Demanno eat of it, GoD in his wrath would cause all his functions to fail in their effect.

Ir sometimes happens that very old men, when they are very dangerously ill, desire their descendants and relations to be assembled, to whom they give directions about the disposal of their body : that is, if they wish not to be buried, some direct their remains to be placed under the shade of a tree, while ochers order them to be thrown into a river. Their will in this respect is strictly attended to, and the two Boge ceremonies are observed.

Before the chiefs of the hills put themselves under the protection of the English government, wrongs and injuries committed by the inhabitants of one village on that of another, were in general decided by the sword; but disputes and differences, whether with regard to property or otherwise, between inha-
bitants of the same town, were always settled by the Maungy and his officers: the first of them in rank is the Cutwal (who is the chief's deputy) next the Phojedar, and lastly the Jemmadars, who have a certain number of men under their authority, to inspect the conduct of the inhabitants, and report it to the Phojedar ; to these, old and experienced men were added, and usually called in to assist, when the subject of litigation was of importance: at present, none but trifing disputes are settled by those officers; for murder and all capital crimes, the delinquents are brought to Bhigfalpore or Rajamahall, to be tried by an assembly of the chiefs, agrecably to the engagements entered into by Mr. Cleveland with the head Maungies. Though the Maungies of all the villages also assemble on these occasions, none but the Sirdar Maungies, or chiefs of tuppohs, and cheir Nails, or deputies, sit in judgment. On passing sentence, it is customary for them to ask the inferior Maungies, if the decree be not just. Should these question it, another examination takes place, when the decision may be the same or amended.

I have been present at several of these trials: The forms observed, were first to swear in the judges according to their faith : this being peculiar, their various ways of taking an oath may not be thought unworthy of description. The hill-:vord Deeben, is an oath. There is no parsicular officer for administering oaths; any person may do it. The form in general use at these trials, is, for a mountaineer to put a little salt on the blade of a Tulevar, or scimitar, whea
he says, "if you decide contrary to your judgment, and falsely, may this salt be your death." The person swearing having repeated this imprecation, and applied it to himiself, the part of the blade where the salt is, is held above his mouth, which he opens, and it is washed oif into his mouth with some water, that he may swallow it. Those who, from indisposition or infirmity, do not like to swallow the salt, repeat the oath, putting their hand on two arrows fixed transversely in the ground, at about a cubit's distance, with some salt between them. On some occasions a man swearing repeats the oath, with his hand on a sword; while others repeat it, laying hold of any person's hand: and all these forms are considered equally binding. Next, the commitment and charge are read and explained by the collector's officer, in: his, the collector's presence; then the delinquent must state his defence or confess his crime, sitting on his hams; after which the Marngy and Phojedar. of the village where it was committed, declare what they know of it. Here the criminal is apparently his own accuser, by never deviating fromz truth; the vice of lying being considered an aggravation of any crime; but I have known the accused refuse to speak; for lying has not obtained. much among these highlanders. A man convicted of falsehood, or who violates a promise, is called pas-: siary; the meaning of which is, a person to whom no credit is due, though he should even speak truth, and whose professions or promises are not to be depended on. Such a person is not admitted on any arbitration,
arbitration, or on any committee to settle trivial differences.

Formerly, when a man of one village had a claim upon an inhabitant of another, it was not uncommon, if the latter denied it, and refused to have the matter brought to trial, for the complainant to apply to the chief of his village, to unite with the heads of one or two others, to whom presents were made in proportion to the nature of the dispute, to form a junction with all their vassals to plunder the village where justice was denied, and to carry off the offender : the division of the booty was according to the rates allowed the Maungies, their officers, and vassals. In such troublesome times much was not taken, as all property, not of immediate use for domestic purposes, was usually concealed; the chiefs could therefore only have the first choice of the utensils and apparel which fell into their hands. The relations and chief of the village from which the captive was taken, after some time were wont to send a present to the complainant, acknow. ledging the demand; and promising to abide by the award which arbitrators should give, on his being released: these conditions were complied with, the prisoner was enlarged, and he and his relations had to make good the loss sustained by the inhabitants of the plundered village, as well as to pay the costs of the arbitration.
Ir some times happened on such gecasions as the above, that the inhabitants of the village intended to be plundered, got intelligence of the design, and

Vol. IV.
G
the
the cause of it ; on which it was usual for the Maungy to call on his vassal, to answer to the accusation : if he acknowledged it, an ambassador was dispatched to the complainant, desiring him to desist from his intention, and to name arbitrators, that justice might be done: on the other hand, if the charge was denied, and the accused exhorted his chief to stand on the defensive, with an assurance that he would either prove his innocence, after the invasion, or make good the loss sustained on both sides, the vassals were assembled and stationed to guard every avenue leading to the rillage. Night attacks were most common; but these precautions were in general sufficient to induce the assailants to defer a scheme which was merely to plunder, and, as long as the defendants were alert, nothinge was attempted; the invaders therefore kept in their neighbourhood, and, when they were harassed by watching, the party advanced, and a man was sent forward to scatter a soporific dust to windward of the village, which, it was believed, would put every inhabitant in it to sleep in less than an hour after dark. In this persuasion they sushed on to plunder, and, carrying off all that was valuable, retreated; soon affer which a deputation was sent from the despoiled village, desiring an arbitration to be appointed, to try wherher the accusation was just which was alleged against the inhabitant of it: if proved, he was bound to make good the loss sustained, as well as to commute the lives that might have been lost on both sides: on the other hand, if acquitted, all this fell on the accusers.

When

When a man by accident killed one of his brother sportsmen in hunting, it was customary for the party to carry the body to the village, where the relations of the deceased, having declared the party had no right to slay their kinsman, set out and implored the assistance of a neighbouring Maungy with his adherents, to obtain justice: having succeeded, they returned in force to plunder the homicide's houses, and took eatables from every house in the village: at the conclusion of this violence, the serdars of the village assembled to sit in judgment on the part of the hunters, whilst those of the assailants met them on the part of the kinsmen of the deceased. The sentences on such occasions were seldom less than ten or twelve scores of rupees, as a commutation for the blood of the manslayer, two-thirds of which ransom he had to pay, and the remainder was recovered from the party of hunters. When the above fine was realized, another complaint was made by the relations of the deceased to the Maungy of the village to which he belonged, claiming some consideration for the children which he might have begotten had he lived. Judges being appointed to examine the second demand, the fine was about two or three scores of rupees from the homicide.

When a woman had poisoned her husband, and confessed the fact, judges were appointed to settle a just retribution; ten or twelve scores of rupees were commonly adjudged, and the sum was recovered
from the woman and her relations, to whom she was returned.

A person convicted of stealing cloth, was not fined more than five or six rupees, and a turban ; yet the thief, by praying for an abatement of this, was in general let off, on paying one rupee, and producing one hog and a turban.

When an orphan, who had no relations or property, was convicted of stealing money, grain, or cloth, he was compelled to restore the stolen goods, and flogged and discharged. Judges were not appointed for such a trial, as the accused was supposed neither to have property nor friends to pay the fine for him.

When grain had been stolen, and the thief unknown, the Cherreen was first resorted to : whether this was successful or not, the Satane was next tried to confirm the discovery, which might have been made by the Cherreen, or to find the thief by it if the Cherreen had been unsuccessful. In the event of both failing, or on their being firmly denied by the accused, he was compelled to attempt the Gobereen, which was deemed unerring. On such slender proof the accused was seized and punished, till he acknowledged the theft, and declared whether any person advised him, or was an accomplice: he was then set at liberty, and judgés were appointed by the Maungy of the village to inquire what damage had been sustained; which the accused was obliged to make good, and to fine him according to the nature
and extent of his crime. On these occasions the fines were heavy, to deter others from committing similar offences.

When a chief had killed a poor man, the officers of his own village, and those of a neighbouring village, were assembled, with some sage old men for the trial. Should the fact be established, the relations of the deceased might refuse a commutation for the blood of the murderer ; "in which case he was delivered up to them to be put to death, and his kinsmen had to pay the expences of the trial. The ransom was in general ten or twelve score of rupees; but the relations of the deceased had the option of remitting the fine, and of pardoning the murderer.

All applications to a chief to apprehend any person in a civil cause, and to appoint judges for a trial, are accompanied with a fee; and any person borrowing money for that purpose, is compelled to pay two rupees for every one so borrowed, at the issue of the suit, whether he gains it or not.

A chief has no more right to strike a poor man than the latter has to strike him: the crime and punishment in either case is equal. Should a chief without provocation strike a poor man and draw blood, the latter complains to the Cutzoal, who with the Phojedar, and some old men, being assembled, and having heard the complainant, they depute an agent to their chief, to require him to answer the charge; which being acknowledged, the agent returns, and informs the court that the offender con-
fesses his crime: the complainant then demands a certain sum for reparation, and the agent sets out to the offender, who, on begging a remission of the fine, in general gets off by furnishing a hog; which being killed, the blood is sprinkled on the wounded person. A similar misfortune is thus supposed to be averted, and the parties reconciled, the aggressor paying the expences of the trial.

Should a man borrow some Kosarane for seed from another, and refuse to repay for eight or ten years, and till he is compelled, the lender, on establishing the loan before judges, will receive three rupees for each seer that is due to him.

Tire same penalty is levied from those who refuse to repay a loan of Takalloo.

Whoever accuses a man of committing incest with his mother, on proof of such abuse before a jury, will be fined a rupee for the complainant, and a hog for a feast to his judges.

Shouid a man, who is sober and walking about, rouch another who is asleep, or sitting, with his foot, the aggressor will be fined a rupee for the complainant, and a hog for a feast.

A person committing the same offence while drunk, is let off on giving a fowl to the complainant.

Should a man who is intoxicated, by day light, and willingly vomit on another, on conviction before judges, he will be fined a turban and one rupee: should he however, from its being dark or otherwise, not see the person, he is forgiven.

Should a man seize and cultivate a field which his neighbour had begun to clear, this offence not being cognizable before judges, the latter imprecates divine wrath, that nothing may grow on it. It is believed that his prayers will be attended to, and that the produce will be small comparatively with former years.

If two men quarrel, in their cups, and blood be shed, -when sober, judges are appointed, and the person who cut his antagonist is fined a hog or a fowl, the blood of which is sprinkled over the wounded person, to purify him, and to prevent his being possessed by a devil: the flesh of whatever has been sacrificed is eaten, and a feast reconciles the combatants; but, if the men quarrel while sober, and one be wounded, judges are appointed, 'and, exclusive of a hog or a fowl for the purpose above described, the person who drew blood from his antagonist is fined one rupee, and a hog for the Maungy of the village, and, at the discretion of the judges, is compelled to pay a fine to his wounded antagonist.

Should a man, by design or accident (in carrying fire) set fire to a jungle, whatever loss is sustained by the flames spreading, and burning grain, or mens property, he must make it good. If a town should be set on fire by accident, and the whole be burned, the person who accidentally caused the loss is not fined, because the loss sustained would be too great for one person or family to defray; but, if only one or two houscs should be burned, the offender and family are obliged to make entire restifution,

If a man be detected by a woman sitting on her cot, and she complains of the impropriety, and demands a fowl as a forfeit, he complies; but she returns it: on the other hand, if a man detects a woman sitting on his cot, and he complains and demands a fowl, she must produce it, and he kills the fowl, sprinkling the blood on the cot to purify it : the woman is then pardoned.

Women at certain times are considered impure : should one in such a condition touch a man by accident, even with her garment, he is defiled; and for this offence she is fined a fowl, which is sacrificed, and the blood sprinkled on the man to purify him. Women at such times may talk to men, but not touch them. A man, whose wife has that impurity, must not himself during that period sit on a chief's cot; for so doing the fine is a fowl, and the blood is sprinkled on the cot to purify it. He must not cven eat or partake of any thing at a festival during fuch period of separation; and any person detected in this offence, must pay the expence of purification from this pollution by another festival, to be held for that purpose at his expence.

When a party are assembled to go a hunting, and have arrived at their ground, the Cherreen is held to ascertain which of the party will be most acceptable to the God of Hunting, to return thanks for the success they may have; two hen's eggs are given to the person named. This ceremony over, some are stationed at the skirts of the wood, while others scour it to drive the game to them. On their killing eithe:
either a hog or a deer, the preacher breaks one of the eggs on the tooth of the animal, and throws the contents on its head, at the same time returning thanks to Autgha, the God of Hunting. This is observed on the death of all large game. On their return home with their game, the heads, the tails, and flesh on the inside of the loins, being separated, are considered sacred; and women are not allowed to taste of those parts ; but the hunters feast on them, and the rest (one hind quarter being first given to the fortunate sportsman for his share) is equally divided among the party for their families. When the hunters have finished their repast, the one who killed the game sacrifices a fowl to Autgha, the blood of which is shed on the fore-teeth of the game, with thanksgivings to the God; and the preacher, having cut up the heart, that the blood of it may fall on his bow and arrow, breaks an egg on it, praying again to Autgha.

Should a woman privately eat of those parts of which they are forbidden to taste, the mountaineers believe that Autgha will be offended, and prevent their having any success in hunting on any future excursion; and, if they do not happen to kill some game, the failure is attributed to the above cause ; and the Cherreen, or suspending a stone to a string, is resorted to, to discover the offender, who, on such doubtful proof, is fined a fowl; which, being sacrificed to Autgha, the God is thus supposed to be appeased, and will be propitious to them on the next hunting party.

If a hunter goes out alone, and wounds some game, and returns for assistance to find and bring it home; those who go with him are entitled to one half.

When it is found that wild boars or other game have been in a cultivated field, the owner leaves a road for the beasts to return, and erects a stage to watch their coming at night. Should he wound any, he repairs to his village to announce his success, and to beat up for volunteers to assist him in ascertaining which way the game went, that they may know where to find it in the morning. They are directed in this by the groaning of the animal, which cannot run far, the poison which they use on their arrows being of a most subtile nature; yet its being of so fatal and noxious a quality does not prevent their eating the game, after cutting out a large piece of the flesh round the arrow, which is thrown away. I heard an instance of a man's eating that part, and dying soon after. A sportsman, who gocs out alone, keeps half of whatever game he kills; the remainder (after the Maungy has taken several joints of the chine) is divided among the inhabitants of the village.

A skilful and fortunate sportsman, who, gives up all his time to hunting, daily kills more or less. When ten or twelve score heads of game have fallen by his skill, it is customary for him to take all the tecth and horns to a convenient place for prayer, and to sacrifice a hog over them to Aursifs, the God of Hunting, who some times favours the
the huntsman, by drawing some game within view of the fostival, that he may sally forth to kill it; and whatever his success may be on this occasion, it is considered as an addition to his offering, and accordingly eaten on the same altar. It is to be observed, that every sacrifice to their God is eaten.

When a hunter wounds game which he cannot find, he returns home to collect his friends to go in search of it : in the interim, should any person or persons pick it up, carry it off and eat it,--on detection, they will be fined by the judges five rupees and as many hogs; though the complainants in general let such offenders off, on their delivering one rupee and one hog.

Dogs that will hunt are held in estimation by the mountaineers; and any person killing one, is fined ten or twelve rupees.

The penalty for killing a cat is whimsical : a person guilty of it must collect all the children of the village, and distribute salt among them, that he may avert divine vengeance.

It is related that a man, sitting with another, observed his companion's clothes on fire, and that, for informing him of it, the latter demanded a fowl, to shed the blood of it on his burned clothes for his friend's officious kindness, observing also that the clothes were his ; and that he had no business to say any thing about them. This practice is now obsolete as far as regards the exaction of a fowl; but the circumstance is related to this day.

Hos-

Hospitality is considered a virtue; and when a relation or a man of rank comes to see his friend, he is kindly received, and treated as sumptuously as the ability of the host will admit of. Strangers travelling are well received; a house and bedding is allotted them, and the inhabitants contribute to furnish them with as much provisions as they can eat.

When a peasant waits on his chief to represent any grievance, having made his salan, he is not of himself to enter on the subject of it, unless he is desired, as his chief may be thinking of business of importance, when it would be improper and disrespectful to interrupt him; but due attention is always paid to the complainant.

A peasant does not sit in the presence of his chief without being desired to do so ; and respect requires that he should decline it two or three times before he obeys, taking care to sit at a good distance. When business leads them to their chief, it is customary to have him previously advised of it. A man who has business, if he has any penetration, will observe at a distance what humour his chief is in, before he approaches him. If he hould seem pleased, they think it right to embrace the moment, keeping at a respectful distance and advancing but a step or two as desired; but, if he is in an ill-humour, the complainant generally defers his suit. It is considereci disrespectul in an inferior, even to enter a chief's house withont being invited. When a chief visits another
another chief, the guest is always desired to seat himself first.

In addition to the foregoing account, a few general remarks may neither be deemed superfluous nor unnecessary. The natives of these hills are mostly very low in stature, but stout and well proportioned. To find a man six feet high would, I believe, be a phenomenon: there are many less than four feet ten inches, and perhaps more under five feet three inches than above that standard. It may not however be far from the truth to consider that as the medium size of their men. A flat nose seems the most characteristic feature ; but it is not so flat as the Coffes of Africa, nor are their lips so thick, though they are in general thicker than the inbabitants of the neighbouring plains. I shall not pretend to say whether they ought to be considered the aborigines or not: as they have no letter, figure, or hieroglyphic, all accounts of their ancestors are oral. It will however be remembered, that they consider themselves descended from the eldest of the seven brothers who, according to their tradition, pecpled this earth, and who was an outcast for receiving his portion of every thing eatable on an old dish; that the hills in the districts of Ehagalpore and Rijamahall were allooted for him and his descendants: these being rather unproductive, and their wealthy neighbours refusing to associate with them, they had no alternative but that of plundering. These causes are assigned for their remaining in barbarous ignorance. In numbers, the hill-language has only words
for one and two, which are variously expressed, as applied to different subjects : they however use the Hindu words in counting from two to twenty ; and, when reckoning any thing which exceeds that quantity, they begin again at one, numbering by scores. Of their manufacture and commerce little can be said. The small and common Hindostany bedsteads are made by the highlanders, and brought down for sale, with the wood-work of ploughs rudely shaped. Wood for various purposes, as well as for fire, with charcoal, and planks shaped with a hatchet (probably that they may be more portable) are also brought down for sale: to these, bamboos, cotton, honey, plantains, sweet potatoes, and occasionally small quantities of grain, may be added, and will, I believe, include all the articles, which they barter for their few wants from the plains ; such as salt, tobacco, rice, for the purpose of worship; cloch, iron heads for arrows, hatchets, crooks, and such izon implemenis as they may have occasion for. I may add, that they have no manufactures: except the bed-steads, there is nothing made in the hills: they are even indebted to their neighbours on the plains for earthen pots. Salt and tobacco are their principal wants; for, in describing such hill-villages as are nearest market-towns, or such as have hauts on the plains, it is common to say, such a hill-village is supplied with these articles by such a town on the plains. Thus their trade is confined to a very narrow compass. Cultivation is in as unimproved and rude a state as it well can be, and seldom more ex-
tensive than for the immediate consumption of the cultivator and his family. The women as well as men work in their fields. The bringing of wood and water for all domestic purposes, cooking, cleaning, arranging all house affairs, belong to the former; and they are also employed in carrying wood, bamboos, and other things to market on the plains, to exchange for salt and tobacco. Hence it appears, that the greatest share of labour falls to the women; and a man is rich in proportion to the number of his wives, who are so many labourers. There are two sorts of soil which the mountaineers cultivate, the one a black earth, which is esteemed the best; the inferior is called red, is stiff, and of the nature of clay. Where there is earth sufficient for the purpose of cultivation on the sides and tops of hills, the trees, with which these hills are well covered, are cut, leaving pretty large stumps; and such as cannot be conveniently moved, or are wanted, are burned where they fall, in the places so cleared. Holes are made flom three to four inches deep with a piece of hard wood pointed, in the middle of June, or setting in of the rains: in each of these, two grains of Takalloo, two of Kosarane, two or three of Líhary, and from five to seven of Naito, are thrown in, when they are filled with earth. These holes are not made nearer than a cubit and a half; if less space was left, the grain would be too thick, and not so productive. Koppai, Gungarea, Mooto, and Koodiama, are scattered in the same field, with Massee, which is sometimes scattered, and at others, put into separate small
holes. In this field Kuldee is also planted, and slips of the Marallee; Bareally, or yams, are cultivated, and grow wild likewise; Takalloo, or Indian corn, is the same as what is variously named in the plains Bootah, Janeara, Jewar, Muckai; but is larger and better on the hills, and is reaped in November. Kosarane is like the Callye grain of the plains in taste, but is white, and rather larger : it is reaped at the latter end of November and beginning of December; Lahary is a large pea, reaped in December; Ncito is a round seed, reaped in December; Kappai is cotton, and does not flower before the third year, when it is gathered in March, April, and May, and sells for as much as cotton produced in the plains ; Gungarea is a grain smaller than the Cheernee of the plain, is reaped in September and Ocaober; Mooto is somewhat like the Gungarea, and reaped at the same time ; Koodima is also very small grain, and reaped as the two former; Mossee is the same as the Bhattmoss of the plains, but a smaller grain, and is reaped in September and October; Kuldee is a large plantain, bears some fruit the second year, but more plentifully the third and fourth, after which it declines; Marallee is the same as the Sakkerkund, or sweet potatoe of the plains, bur much larger, is taken out of the ground in Nóvember, December, and Jamuary. The foregoing includes all the cultivated productions of the hills: they are, as may be supposed, of a hardy mature, and are plentiful or scanty, in proportion to their having enough or too little rain, for they trust entirely to the monsonn for water, having neither reservoirs, nor any method of
watering their fields; which in fact might not be possible, from their situation. This last season their crops in general failed, from want of rain : on these occasions, the mountaineers cut more wood and bamboos, and make, greater quantities of charcoal, for which they find a ready mart in the lowlands, and exchange it for grain. Froin this resource, and the thriftyness of some among themselves, who are provident, they averted a famine during the great scarcity in 1769 and 1770 : many of the inhabitants of the plains retired to the hills; where they got a subsistence; but, having associated and mixed with the highlanders, they of course lost their casts, and therefore many remained with them. The Takallon is the most productive of any of their grain, and is their chief subsistence. There are no esculent herbs, nor garden-stuff on the hills. Pungdoallee, the same as Sootnee in the lowlands, grows wild, and is larger than the Sootnee. In times of scarcity, Singlat (in Moors, Jingoor) is found in the jungles, but it must be boiled in several waters, or well roasted, and is a dangerous unwholesome food: of much the same nature is Kindallee, which is sliced thin and boiled in sour waters, otherwise it is poisonous. The Mengotree, Tamarind, Kuthul, Bale, Burrel, Bayer, Mowvwah, Jamon, Phulsah, Dwarf Cucljoor, that yields a bad kind of date, and Keand, with others peculiar to the hills, grow wild. Their domestic animals are hogs, goats, and fowls; they have also some dogs and cats; the wild animals are in general the same that are met with in the plains, except a species of

$$

$$

large deer, and another remarkably small; the for mer are called Mauk, and the latter Illarroo.

The internal government of the hills, or the connection between the Maungy and his Dunigarear (adherents) is a simple engagement for mutual protection. The Maungy swears to do them justice in disputes among themselves, and not to suffer them to be oppressed by others; and they, on their part, swear fidelity to him, as long as he shall protect them and do them justice : a failure on either part dissolves the contract; in fine, the Maungy is no more than primus inter pares. The Dumgarear apply to him for land to cultivate, and he allots it: when the crops are ripe, the Cutzoal and Phojedar, on the part of the Manngy, repair with the proprietor of each field, to estimate what portion he can afford to give his Moungy: thus an easy and amicable contribution is levied by the consent of the cultivator, who has no fixed proportion to yield to his chief. If the crops be luxuriant, he willingly gives what he can spare; if scanty, very little is demanded : if obstinately refused (a case which seldom or never happens) the Maungy cannot forcibly take any part; but, as a punishment, he can prevent this refractory Dultgarear from cultivating in his territory again. The Cutroul and Phojedar receive a little grain for their trouble, or perhaps the Maungy remits their contribution; for these officers, as well as the Muungy himself, cultivate their fields : they have no salary; the stations perhaps give them some degree of consequence; and on all trials they either receive some
compensation; or are feasted; the latter however. from their dispures in general being trivial, is most common. The appointment of Cutwals, Phojedars, and Jemmadars, belong to the Maungies; and he can dismiss from office when any of them offend; the Jemmadar is merely an honorary officer. I cannot now learn at what period the hill-villages were formed into Tuppals. It seems however to have been an association for mutual protection ; for the Sirdar MIaungy, or chief of a Tuppah, receives no contribution from any village but his own, or one in which he resides : when appealed to, or applied to for justice, he is paid in proportion to the amount or magnitude of the cause. He could assemble the sereral Maungies with their adherents on any offensive or defensive operations, but could not compel those to act who disapproved of the motives. In their wars, when highlanders were made prisoners, they were either set at liberty, or were ransomed. In their descents into the plains they were not however so merciful; all who opposed them were put to death; those who made no defence, women and children, were stripped of such valuables as they might have, but neither punished nor made prisoners. On such occasions the chastity of women was held inviolable; for it was beliered, if any of the assailants committed violence on the persons of females, that he would infallibly lose his reason and die. The bow and arrow is the only arms peculiar to these mountaineers; some few have swords, and still fewer have match-locks; but these probably were collected in their predatory incursions
into the plains, either in war or hunting. In general, they use the bow and arrow in the former, but always in the latter, though 1 do not think they are expert archers, when it is considered they are all hunters from the time they can carry these arms; and are so fond of that diversion, that they go out at all seasons, and undergo great fatigue for the gratification which it affords them. A poisoned arrow is always used in hunting, but never in war, though they generally had them, as it is said, to be prepared for any game that might start.

There are no slaves on the hills; slavery can neither be said to have been tolerated, nor forbidden. Parents never sell their children; and those who hire themselves as servants, stay no longer than they agree with or like their masters.

Enough may have been said of their modes of worship: they are not the first race of people who, we are taught, believed that the chief means of pleasing the Gods, and of pacifying them when they were angry, consisted in certain ceremonies, sacrifices, and feasts, in the due observance of which they conceive their welfare depends; for, in praying, the suppliant says little more than to recommend himself and family to the Supreme Being and subordinate Deities, and to promise oblations at the shrine of the God he then worships, provided he is fortunate, and enabled so to do by his prosperity. Their expiatory sacrifices are however confined to the brute creation; there is no instance of their offering up any of the human species to appease the Gods, who are
supposed to be abundantly pleased by the votaries feasting as large congregations of men as they can afford to maintain; for, in proportion to the expence in meat and spirituous drink, the piety of the votary is measured. The part which the Demauno, their oracle, " dreamer of dreams," bears in their ceremonies and forms of worship, has already been described. Before a man yows to sacrifice at any shrine, he consults the Cherreen and Satane: when these agree, he repairs to the Demauno, without informing him of the result of those two processes, but explains to him the cause of waiting on him: the, Demauno is allowed one, two, and even three nights to confer with the Deity in a vision, to prescribe what the suppliant ought to do; and, as it is believed he has familiar intercourse with God in his dreams, his decrees are obeyed, though, when they differ from what was discovered by the Cherreen and Satane, these are held over again to reconcile them. The women neither offer sacrifices, nor approach the shrines of their Gods; even husbands are forbidden to partake of festivals during the separation of their wives. These prohibitory laws regarding women are of an old date, and their origin perhaps not well known.

Colonel Brown, in his account of these hills, forwarded to government in 1779, observes that it was about fifteen years since the hill-people had any government among themselves of a general nature ; during which period they had become dangerous and troublesome to the low country; that their ravages
had been the more violent, as they were stimulated by hatred against the Zemindars, for having cut off several of their chiefs by treachery. The Colonel might bave added, that, during that interregnum or dissolution of government, it was a common practice for the Zemindar's on the skirts of the hills to invite the chiefs in their vicinity, "with their adherents, to descend and plunder the feighbouring Zemindaries; for which, and for the passage through their lands, the mountaineers divided the booty with them. Thus, at one time, from repeated acts of treachery in the Zemiindars; the mountaincers were provoked to take ample vengeance on them, and their unhappy ryots; and at other times, from their engaging the chiefs to matke predatory incursions, to which they were strongly incited, no less from a desire of plundering their more opulent reieghbourṣ, than from the difficulty of obtaining salt and tobacco from the hauts, all friendly intercourse was at a stand ; the low country bordering ôn the hills wás almost depopulated, and travellers could nót pass with safety between Bhairgulpore and Furruckabait, nor could boats, withoit danger of being plundered, put to for the night on the south side of the Ganges between the beforenamed places. It was at this period of double treachery on the part of the Zemindars, and predatory hostilities on' the part of the mountaineers (from which it may not be a strained inference, that the machinations of the former were in a great measure the cause of that necessity which cempelled the latter to such frequent and fatal descents, when these public
and private incendiaries were making large strides, in ruining these once fertile districts) that Captain Brooke was stationed with a corps of light infantry, to avert their utter destruction. On this duty, it is well known that he acquitted hinself with great credit, from his uncommon exertions and success in pursuing the unfortunate mountainecrs unto, their hills, where numbers must have unavoidably, fallen; for it became unquestionably necessary to impress them with a dreadful awe of our prowess : and in this harrassing and unpleasant walfare, I have been well informed by officers who were with Captain Brooke, that his gallant conduct could not be too much commended. He made them sensible of the inefficacy of opposing him in the field, and invited the chiefs to wait upon him and negociate; when he gave a feast to those who came, and made them pre sents of turbans; but before any permanent establish; ment took place, he was succeeded in the command of the light infantry by Captain Browne, who made further progress in conciliating the minds of the discomfitted mountaineers. He placed them on the road from Furruckiabad, near Colgong, to protect the Daveks, on which duty they still continue. From this and other measures of his, Captain Brooke and he, it will be allowed, laid the foundation for the most permanent and happy settlement concluded with the hill-chiefs by the late Mr. Augustus Cleveland, that could possibly be attained. He was sensible, from the rapine and decay of these districts, that the peaceable deportment of the mountaineers
ought to be purchased; and, while he was reconciling them to become subjects to the British government, he bestowed liberal presents in money and clothes to the chiefs, and to all the men and wo-. men who came down to him. Of his generosity they speak with gratitude: and for the blessings and benefit which they derive from the wise and judicious conditions which he granted, and which were confirmed by government, I.: hope they will ever háve reason to be thankful. As long as that government lasts, the comforts and happiness which they derive from them, must ever ensure their obedience. To engage their confidence, Mr. Cleveland, in the early part of his intercourse with the mountaineers, entertained all who offered their services as archers, and appointed many of the relations of the chiefs, officers: they were not (nor are they as rangers, though they very seldom now ask their discharges) bound to serve for any limited time ; the corps, of course, constantly fluctuated, and was frequently, I understand, above a thousand strong. He clothed them; and in less than two years after they were formed, from the confidence he had in their attachment and fidelity, obtained fire-arms for them; in the use of which, I may venture: to observe, that they are expert, and have address; and: I can also without hesitation assert, that they are capable of as high a degree of discipline as any native corps in the service; and I trust I shall have the happiness to prove this in ciue time. Exclusive of having thus employed so many of the mountaincers, Mr. Cleve-

LAND fixed the salary of ten rupees per month for each chief of a Tuppah, three rupees ditto for each of his Naibs, and two for the Munngy of each village, from which there shall be a man enrolled in the hillrangers; but from such as supnly not a man, the inferior Mazngy receives no monthly allowance. In consideration of these establishments, I understand, the chiefs are not only responsible for the peaceable deportment of their own adherents, but bound to deliver over all delinquents, and disturbers of the public peace within their own limits to the collector, to be tried by an assembly of the chiefs, either at Bhaugulpore or Rájamahall, as already related: It has ever been customary on these occasions to feas! the chiefs so assembled. When any report is to be made to the collector, it is the duty of a Naib to wait on him with it, should the chief be indisposed or otherwise prevented.

From these happy and admirable arrangements, digested by Mr. Clevelánd, whose name ought to be dear both to the natives of the hills and lowlands, the ease, comfort, and happiness of the former is ensured (for which they are grateful, and speak of him with reverential sorrow) and peace and safety secured to the latter; and if they have any goodness, they ought not to be less thankful. These solid and essential benefits are attended comparatively with but a trivial expence, and must ultimately be an advantage to government. I have been led to say more on this subject than I intended; yet it may not be thought foreign to it, to add, that the Aumlak and Zemindars erected a monument to the memory of Mr. Cleve-
LAND,
land, nearly in the form of Pagoda, atid that another was also erected the texpence of government, by the order of the Honourable the Governor General and Councilt; on which is the following inscription:

To the memory of-Augusius Cleveland, Esq. Late collectort of the districts of Bhurgulporie, and Rajamuaiall, Who, withour bloodshed or the terrors of authority, Employing only the means of conciliation, confidence, and bencrolence, Attempted and accomplished
The entire subjection of the lawless and savage inhabitants of the fungleterry of Rujamaliall,
Whohad long.infested the neighbouring landa by theirprcdatory incursions',

- Inspircd them with a taste for the arts of civilized lifc,

And attached them to the Britisb Government by a conquest over their minds;
The most permanent, as the most rational, mode of dominion.
The Governor General and Council of Bengal,
In honour of his character, and for an example to others, Have ordered this monument to be erected.
He departed this life on the $1,3^{\text {th }}$ day of Yanuary, $1 ; 84$, aged 29 .
Before I conclude, I must do the mountaineers the justice to mention, that they hare as great a regard for truth as any people on earth, and will sooner diec than deliberatcly tell a falsehood: In this I must; confine myself to those who have not associated ormixed in conversation with their neighbours, the Hindu and Musselman of the plains; where it is well Known, lie and interestrare synonymous terms: and what change in this respect a more famliar intercourse will occasion, I shall not pretend to premise.

They are in general of a cheerful disposition, and humane: both men and women are remarkably bashful. When asked to sing (their notes are wild and drawling, having a slow cadence, from forte to piano ) or dance, they ever answer, that they can do
neither without drinking freely, for they are ashamed until they are intoxicated. Like all people in so rude and uncultivated a state, they are passionately fond of all spirituous liquors, and, $I$ am inclined to believe, prefer that which from its strength will inebriate them the soonest. Hence it appears they are not ashamed of being drunk, and in fact their religion promotes it, for a festival would not be much esteemed, that was unattended with a hearty carouse.

I conceive, instances of remarkable longevity are very rare: I have heard of one man who was said to be more than five score; but, as I have never met with any of them that appeared so old, or that could tell his age, for they keep no account of it, I am inclined to doubt the fact. In a late excursion with Mr. Grant into the hills, we saw an old woman, who was said to be of a great age: she was a relation to a chief, whose house we were at; and having taken' a cheerful glass, with his wives and daughter, of liquors which Mr. Grant had carried up to give them, she set them the example of singing and dancing to us; in which she was followed by the chief and two of his youngest wives, who were at the time far from sober. When we had dined, the meat that remained was given to them ; of which, the family being assembled, they thankfully partook, and made indubitably a more luxurious meal than they ever had before. We took a route in which no European had been; and Mr. Grant, to reconcile thém to so novel a sight, as well as to conciliate their attachment, carried up a variety of presents of

108 ON THE INHABITANTS OE THE MILLS, \& C. clothes, beads, and looking-glasses, which he distributed with money to every family in all the villageswe passed, and thus left them the most acceptable: memorials of their visitors.

Bhaugulpore, June 27, 1792.

## ADDITIONAL REMARKS

$0 \times \mathrm{THE}$

## SPIKENARD OF THE ANTIEN'S.

BY THE PRESIDENT.

NEARLY at the time when the result of my first inquiries concerning spikenard was published in the second volume of our Asiatic Researches, there appeared in the Philosoplical Transactions an account of the Aśdropogon Jwaráncusa, the specimen of which Dr. Blane had received from Lucnow, and which he supposes to be the true Indick nard of Dioscorides and Galen. Having more than once read his arguments with pleasure, but not with conviction, I feel it incumbent on me to state my reasons for dissenting from the lcarned physician with all the freedom

ON THE SPIKENARD OF THE ANTIENTS. IOG dom of a searcher for truth, but without any diminution of that respect to which his knowledge and candour justly entitle him.

In the first place, there is a passage in Dr. Blane's paper, which I could not but read with surprise ; not because it is erroneous or disputable (for nothing can be more certain) but because it is decisive against the very proposition which the writer endeavours to support. "Dioscorides mentions the "Syriack nard," says the Doctor, " as a species dif" ferent from the Indian, which was certainly brought " from some of the remote parts of India; for both he " and Galen, by way of fixing more precisely the " country whence it came, call it also Gangites." We may add, that Ptolemy, who, though not a professed naturalist, had opportunities in Egypt of conversing with Indian merchants on every thing remarkable in this country, distinguishes Rangamati as producing the true spikenard; and it is from the borders of that very district, if we believe modern Iutiuns, that the people of Butan bring it yearly into Bengral*. Now, it is not contended that the new species of Andropogon (if it be a new species) may be the Fudick nard of Dioscoridest, because it was found by Mr. Blane in a remote part of Inclia (for that solitary fact would have proved

* Ptolémée distingue le canton de Rbandamarcotia, en ce qu'il fournit la plante, que nous appellons Spic nard, ce qui peut convenir à Rargamati; et des differentes espéces, l'Irdique est bien la plus estiméc.

D'Anv. Antiq. Gcogr: Ind. 31.

+ Dr. Roxburgh with great reason supposes it to be the $M_{y}-$ ricated Andropogon of Koenig, who mentions the ronts as ovoriferous when sprinkled with water. See Retz. III. Fascico $4^{\dagger}$, and v. 21.
nothing) ; but it is learnedly and elahorately urged, that it must be the true Indian spikenard, because it differs only in the length of the stalks from the nard of Garçias; which, according to him, is the only species of narảus exportel from India, and which resembles a dried specimen seen by Rumphius, and brought, he says, among other countries, from Muckrin, or the ancient Gadrosia; the very country where, according to Arrian, the true nard grew in abundance: for "the Phenicians," he says, " collected " a plentiful store of it ; and so much of it was tram" pled under foot by the army, that a strong per" fume was diffused on all sides of them." Now there is a singular coincidence of circumstances; for our Andropogon was discovered by the scent of its roots, when they were crushed by the horses and elephants in a hunting-party of the Fasir ÁsufudDAULAH; so that, on the whole, it must be the samie with the plant mentioned by Arrian: but it may be argued, I think, more conclusively, that a plant, growing with great luxuriance in Gadrosia, or Mackran, which the Doctor admits to be a marizime province of Persia, could not possibly be the same with a plant confuned to remote paris of India; so that, it Garçias, Rumphits, and Arrias be supposed to have meant the same species of nard, it was evidently different from that of Dioscorides and Galen. The respectable writer, with whose opinions I make so free, but from no other motive than a love of truth, seems aware of a little geographical difficulty from the western position of Macrin; for he first
makes it extend to the river Indus, and then infers, from the long march westward and the distresses of Alfexander's army, subsequent to the discovery of the spikenard, that it must have grown in the more eastern part of the desert, and consequently on the very borders of India; but, even if we allow Gadio. sic, or Gadrosis, to have been the same track of land with Marain (though the limits of all the provinces in Persia have been considerably changed) yet the fiontier of Iudia could never with any propriety be carried so far to the west; for not only the Orita and Arabite ; but, according to Mela, the whole province of Ariana were between Gadrosis and the Indus; and, though Mucrín (for so the word should be written) may have been annexed to Indice by such whimsical geographers as the Turks, who give the name of White Indians to the Persiuns of Arachosia, and of Yellow Indians to the Arabs of Yemen, yet the river Indus, with the countries of Sind and Miltan on both sides of it, has ever been considered by the Persians and firabs as the western limit of Hind or Indica; and Arrian himself expressly names the Indus as its known boundary. Let Gadrosis, however, be Macrim, and let Macrian be an Indian prorince, yet it never could have been a remote part of India in respect of Europe or Egypt, and, consequently, was not mant by Galen and Dioscorides, when they described the true spikenard. It must be admitted, that, if the Siree of Rumphies, which differs littic from the nardus of Garçias, which corresponds for the most part with the new Andropogon, was ever brought
brought from the province of Macratr, they were all three probably the same plant with the nard of Arrian; but, unfortunately, Rumphius thought of no country less than of Persia, and of no province less than of Mackran; for he writes very distinctly, both in his Latin and his Dutch columns, that the plant in question grows in Mackian, which he well knew to be one of the Moluccas*. I am far from intending to give pain, by detecting this trifing mistake, and, as I may have made many of greater consequence, I shall be truly obliged to any man who will set me right with good manners, the sacred laws of which ought never to be violated in a literary debate, except when some petulant aggressor has forfeited all claim to respect.

Arrian himself can by no means be understood to assert that the Indian spikenard grew in Persia; for his words are a fragrant root of mard th, where the onnssion of the definite articles implies rather $a$ nard, than the nard, or the most celebrated species of it; and it seems very clear, that the Grocks used that foreign word generically for odoriferous plants of different natural orders: but Arrian in truth was a mere compiler; and his credit, even as a civil historian, seems liable to so much doubt, that it cannot be safe to rely on him for any fact in the history of nature. "We cannot, says the judicious and ac"curate Strabo, give easy credence to the genera-

* Hi flores sæpe, immo vulgo fere, observantur in vetustis Sirce stipitibus, quii in Tirnata, Motion, et Mackian créscunt. Vol 5. Lib. 8. Cap. 24. p. 182.

" lity even of contemporary writers concerning "Alexander, whose fame was astonishingly high, " and whose historians, preferring wonders to truth, " wrote with secure negligence; well knowing, " that, as the farthest limits of Aisia were the scene " of his actions, their assertions could hardly be dis" proved." Now Arrian's principal authority was Aristobulus of Cassandra, whose writings were. little prized by the antients, and who not only asserted, " that Gadrosis produced very tall myrrh-trees, " with the gum of which the Prenicians loaded many " beasts" (notwithstanding the slaughter of them from the distress of the whole army) but, with the fancy of a poet describing the nest of a phocnix, placed myrrh, incense, and cassia, with cimnamon and spike. nard itself, even in the wilds of Arabia." The fruit" fulness of Arabia," says Arrtan, " tempted the " king of Macedon to form a design of invading it; " for he had been assured that myrrh and frankin" cense were collected from the trees of that coun"try; that cimmamon was procured from one of its " shrubs; and that its meadows produced spontane" ously abundance of spikenard." Herodotus, indeed, had heard of cinnamon in Arabia, where the Laurus, to the bark of which we now give that name, was, I verily believe, never seen : even the myrrh-tree does not seem to have been a native of Arabia; and the public are now informed that it was transplanted from Albysinian forests, and has not flourished on the opposite shore; but, whatever be the countries of myrrh and cinnamon, we may be cer-

 ADDITIONAL REMARKS ON THEtain that any learned $A r a b$ would laugh at us, if we were to tell him that the Sumbulu'l Hind grew wild in abundance on the plains of Tahámah. It seems a bold allegation of GarçIas, that he has exhibited " the only species of nardus known in India, either " for consumption by the natives, or for exportation "to Persia and Arabia." If he meant that any plant was either used in this country or exported from it by the name of nard, he had been strangely deceived; and if he meant, that it was the only fragrant grass used here as a medicine, or as a perfume, his error was yet more gross. But, whatever his meaning might have been, if the nard of Garçias and of Arrian was one and the same plant, it is wonderful that it ever should have been exported to Persia and Arabia, where it grew, we are told, in so great abundance. The nard of Arabia was, probably, the Andropogon schenanthus, which is a native of that country: but, even if we suppose that the spikenard of India was a reed or a grass, we shall never be able to distinguish it among the many Indiant species of Cypirus, Andropogon, Schonus, Carex, and other genera of those natural orders, which here form a wilderness of sweets; and some of which have not only fragrant roots, but even spikes to the ancient and modern senses of that emphatical word; one of them, which I never have scen in blossom, but suppose from its appearance to te a Schemus, is even called Ginardu, and its dry root has a most agrecable odour; another which Rheedenames Bálaca, or Ramacciam, or white Irivili, and which Burman thought a variety of the Schuenanthus,

Sch.enanthus, is a considerable article, it seems, of $\ln$ dian commerce, and therefore, cultivated with diligence, but less esteemed than the black sort, or Carabála, which has a more fragrant root, and affords an extremely odoriferous oil*. All those plants would, perhaps, have been called nards by the antients; and all of them have stronger pretensions to the appellation of the true spikenard, than the Febrifuge Andropogon, which the Hindues of Behár do not use as a perfume. After all, it is assuming a fact without proof, to assert that the Indian spikenard was evidently gramineus; and, surely, that fact is not proved by the word arista, which is conceived to be of a Grecian origin, though never applied in the same sense by the Greeks themselves, who perfectly well knew what was best for mankind in the vegetable system, and for what gift they adored the goddess of Eleusis. The Roman poets (and poets only cited by Dr. Blane, though naturalists also are mentioned) were fond of the word arista, because it was very convenient at the close of an hexameter, where we generally, if not constantly, find it; as Homer declares ln Lucian, that he began his Iliad with mãrv, because it was the first commodious word that presented itself, and is introduced laughing at a profound critic, who discovered in that single word an epitome of the whole poem on the wrath of Achilles. Such poets as Ovid and Lactantius, described plants which they never had scen, as they described the nest of the

[^7] Indica, and a note from Herman on the valuable vil of Seree.
phonix phœnix, which never existed, from their fancy alone; and their descriptions ought not seriously to be adduced as authorities on a question merely botanical; but, if all the naturalists of Greece and Italy had concurred in assuring us that the nard of India bore an ear or spike, without naming the sourse of their own information, they would have deserved no credit whatever; because not one of them pretends to have seen the fresh plant; and they have not even agreed among themselves, whether its virtues resided in the root, or in the husky leares and stalks that were united with it. Pietro della Valle, the most learned and accomplished of eastern travellers, does not seem to have known the Indian spikenard, though he mentions it more than once by the obsolete name of Spirgonardo; but he introduces a Sumbul from Khata, or a part of Cliina, which he had seen dry, and endeavours 10 account for the Aralic name in the following manner:-" Since the Khatáan "Sumbul," says he, " is not a spike, but a root, it was "s probably so named, because the word Sumbul may " signify, in a large acceptation, not only the spike, " but the whole plant, whatever herb or grass may be "s sown; as the Arabic dictionary *, entitled Kamms, "t appears to indicate." The passage, to which he

- Giacchè il Sombol del Cataio é raçdice e non è Spiga, potremmo dire, che cosi s'i chiani, perche forse la parola Sambol possa piu largamente significare non solo la spiga, ma tuttu la pianta diogni erba ò biada, che si semini; come par, che il Camùs, vocabolario Arabico, ne dia Indizio. Lett. 18 di Baghdad.
alludes,
alludes, is this: "r Sumbul," says the author of the Kámús, " is an odoriferous plant, the strongest of " which is the Siri, and the weakest the Hindi; " but the Sumbul of Rim has the name of nardin." I suggested in my former paper, and shall repeat in this, that the Indian spikenard, as it is gathered for use, is in fact the whole plant; but there is a better rason why the name Sumbul has been applied to it. By the way, Della Valle sailed, as he tells us, along the coast of Macrán, which he too supposes to have been a part of Gedrosia; but he never had heard that it produced Indian spikenard, though the Persians were fully acquainted with that province ; for he would not have omitted so curious a fact in his correspondence with a learned physician of Naples, for whose sake he was particularly inquisitive concerning the drugs of Asia. It is much to be wished, that he had been induced to make a short excursion into the plains of Marran, where he might have found, that the wonderful tree which Arrian places in them, with flowers like violets, and with thorns of such force and magnitude, as to keep wild beasts in captivity, and to transfix men on horsebach who rode by them incautiously, was no more, probably, than a Mimosa, the blossoms of which resembled violets in nothing but in having an agreeable scent.

Let us return to the Arabs, by whom Droscorides was translated with assistance, which the wealth of a great prince will always purchase, from learned Greeks, and who know the Indian spikenard better than any European, by the name of Sumbulu'l Hind. It is no wonder that they represent it as weaker in

## 118 ADDITIONAL REMARKS ON THE

scent and in power than the Sumbul of the Lower Asia, which, unless my smell be uncommonly defective, is a strong Valerian; especially as they could only have used the dry nard of India, which loses much of its odour between Rangpuir and Calcutta. One question only remains (if it be a question) whether the Sumbulu'l Hind be the true Indian spikenard? for in that case, we know the plant to be of the natural order, which Linneus calls aggregate. Since the publication of my piper on this subject, I put a fair and plain question severally to three or four Musselman physicians: "What is the Indian " name of the plant which the Arabs call Sumbulu'l "Hind?" They all answered, but some with more readiness than others, Játimansi. After a pretty long interval, I shewed them the spikes (as they are called) of Jatámánsi, and asked, what was the Arabic name of that Indian drug? They all answered readily, Sumbulu'l Hind. The same evidence may be obtained in this country by any other European who seeks it; and if among twelve native physicians, versed in Arabian and Indian philology, a single man should, after due consideration, give different answers, I will cheerfully submit to the Roman judgment of non liquet; my own inquiries having convinced me, that the Indian spikenard of Dioscorines is the Sumbulu'l Hind; and that the Sumbulu'l Hind is the Jatámánsí of Amarsinh. I am persuaded, that the true nard is a species of $V a$ lerian, produced in the most remote and hilly parts of India; such as Népál, Morang, and Butan, near which Ptolfmy fixes its native soil. The commer-
cial agents of the Dévaraja call it also Pampi; and, by their account, the dried specimens which look like the tails of ermines, rise from the ground, resenbling ears of green wheat, both in form and colour: a fact which perfectly arcounts for the names Stachys, Spica, Sumbul, and Khiishah, which Greeks, Romans, Arabs, and Persians have given to the drug, though it is not properly a spike, and not merely a root, but the whole plant, which the natives gather for sale, before the radical leaves, of which the fibres only remain after a few months, have unfolded themselves from the base of the stem. It is used, say the Butan agents, as a perfume, and in medicinal unguents, but with other fragrant substances, the scent and power of which it is thought to increase: as a medicine, they add, it is principally esteemed for complaints in the bowels. Though considerable quantities of Jatámánsí are brought in the caravans from Butan, yet the living plants, by a law of the country, cannot be exported without a licence from the sovereign; and the late Mr. Purling, on receiving this intelligence, obligingly wrote, for my satisfaction, to the Dévaraja, requesting him to send eight or ten of the plants to Rangpúr: ten were accordingly sent in pots from Tasisúdan, with as many of the natives to take care of them, under a chief, who brought a written answer from the Rájá of Butan; but that prince made a great merit of having complied with such a request; and my friend had the trouble of entertaining the messenger and his train for several weeks in his own house, which they seem to have left with reluctance. An account of this transaction was contained in one of the last letters
that Mr. Purling lived to write; but, as all the plants withered before they could reach Caleutio, and as inquiries of greater importance engaged all my time, there was an end of my endeavours to procure the fresh Jatamánsi, though not of my conviction, that it is the true nard of the antients.

# ON THE <br> DHANE'SA, OR INDIAN BUCEROS. 

## BY LIEUT. CHARLES WHITE.

```
COMMUNICATED BY LIEUT. FRASER.
```

THERE are two distinct species of this bird; one called Bregma Dumase, and the other Putteal Dunnase.

I shall first treat of the Bregma, which is divided into two kinds; the specific marks of which I shall hereafter mention.

The Bagina Dunnase is a very remarkable bird, and, I believe, has not hitherto been described. As far as lies in my power I shall endeavour to rescue it from a situation so unworthy the distinction it has it strong claim to among the curious procluctions of nature.

Ir may be necessary to premise, that the names of brack-homed and white-horned are given by myself, the natives not making any distinction between them. I have bestowed upon them these names from the difference of the bases of their horns.

Black-horned, Bregma Dunnase, with a large double beak, or a large beak surmounted by a horn shaped like the upper mandible, which gives it the appearance of a double beak. The horn is hollow; at the base brown, with a broad edging of black, quite hard; a black mark runs from about one inch from the base to the point of the horn, very irregular in iss breadth, in the centre reaches to the junction of the horn with the upper mandible; upper and lower mandible serrated, and separate from each other about three inches in the middle of the beak longitudinally ; upper mandible marked with black at its junction with the head, which part is quite hard; immediately below this the lower mandible has a large black mark, which appears on both sides, and joins at the bottom ; joining to this, and covering the base of the lower mandible, is about an inch of white shrivelled skin; between these, at the edge of the mandible, is a small brown spot covered slightly with feathers; the rest of the beak and horn cream colour, patched with yellow, except the point, which is much whiter ; the nostril placed at a small distance from the head, in the junction of the horn with the beak; head, neck, back, and coverts of the tail, black; breast, belly, thighs, and coverts of the vent, white ; scapulars, greater and lesser coverts of the wings, black, varying to a greenish tinge; under coverts of the wings, white; primaries, white at their base, then black, with three inches of white at their ends; secondaries, nearly the same; tertials black; a few white feathers on the outward edge of the wing, just below the shoulder; tail cuneiform,
two midale feathers black, longer than the rest, which are white, four on each side; crested, close; the feathers extending a little way down the neck; eye, speculum black, irides reddish brown; the cheek immediately round the eye, and extending from the beak to the ear, devoid of feathers, consisting of a shrivelled skin, which is nearly black; ear-feathers about an inch long, extending partly across the head; tongue short, formed like a dart, with the ears of the barb raised above the shaft ; near the epiglottis it swells to the size of a small nutmeg, which part is perforated; when the mouth is open, a black and brown knob appears below the upper mandible, rising from its base to an inch beyond its apparent junction with the head; legs and feet black, tinged with brown and dirty white; claws large and strong, three in front, and one behind; length, upon an average, from the forchead to the tip of the tail, two feet eight inches; extent, three feet two inches.

White-horned Bagma Dunnase, agreeing with the former in description, except in the following particulars: the horn in these is generally smaller, and blunter at the point, and at the base it is soft, consisting of a membraneous substance; the ground white, marked with crimson; the skin, which covers the base of the lower mandible, is very differently shaped, and is much stained with crimson; only a small spot of black upon the upper mandible, where it joins thehead, which junction is soft; eye black, the skin round the
eye, extending to the ear, white, marked with crimson: the ear-feathers form a curve, beginning in the centre of the black mark of the lower mandible, running along it, and rising above the ear, where it joins the crest. In some I have observed the white tailfeathers marked in the web with black at their base. These birds in size are rather smaller than the first.

Putteal Dinmase, with a double beak, or horn, upon the upper mandible, over which it curves about half way, base hid in feathers; horn black, except at the lower edge, near the point, which is brown; the upper mandible black in the middle, shaded off to white at the point; lower mandible the same, white at the bottom, both serrated; a small black projection from the bottom of the lower mandible crested, cinereous, tinged with brown; the feathers, from the eye to an inch over the beak, iron-grey, dashed with brown; ear-feathers dark iron-grey, forming a curve from the lower part of the eye, extending nearly across the head, under the crest; back grey; neck the same, much lighter; breast, belly, thighs, and coverts of the vent, white ; coverts of the tail, greyish brown; scapulars, greater and lesser coverts of the wings, lead colour ; primaries at the base of the web, black, then dark grey, edged with white ; each primary white at the end, near an inch; secondaries nearly the same; tertial greyish brown; under coverts of the wings, white ; tail cuneiform, very long, two middle feathers reddish brown, longer than the rest, which are ferruginous, tipt with near an inch of white, above which is a mark much larger, black; eye, speculum black,
irides
irides reddish brown; from the beak to the ear-feathers, and round the eje, bare; this part is black; legs and feet black, marked with dirty white at the joints; claws large and strong; length two feet five inches, from the tip of the beak to the tip of the tail ; extent two feet four inches.

The last of these birds is to be met with in almost ewery part of the country, more particularly where there are jungles. I have seen a variety of them at Burragong in Sircar Sarun, where, instead of the horn, they had a large knob at the base of the beak, very much resembling that of a wild goose. The one I have attempted to give a description of, was brought to me at Miduapore, in which province, and the extending hilly country, they abound. I have seen them in the vicinity of Sheersotty.

The Burgma Dunnase chiefly inhabits the western range of hills, extending from Neelgur through MoIurliunge, Midnapore, Ramgur, Rotas, towards Biízigur. In Ramgur, I have been informed by an in telligent person, they are to be seen in abundance. He told me that he had seen crouds of them on the Peepultrees, the berry of which they feed upon at times. Their note, or voice, in concert, has a strong resemblance to the mournful cries of monkies, for which this person, deceived by the sound, at first took them. The place where I met with them, was at Midmapore, in the jungles adjacent to which they are to be found from the month of Noveriber to the month of Marcith only; at which time they retire to the hills to breed. I should have been highly pleased could my curiosity
have been gratified in the enquiries I made respecting the œconomy of this extraordinary bird; but the people I had to deal with were poor ignorant folk, from whom I could gain but little information: I therefore can do little more than ascertain one curious fact, and display some qualities of the bird, which may hereafter be of benefit, if thoroughly investigated by some person of medical skill.

These birds have a most remarkable appearance when in the act of flying, from the great size of their beaks, and length of tail. I have seen several of them in this state ; and a more uncouth object I never beheld. The beak, which forms the most prominent feature in this strange bird, may be considered as one of the most uncommonly curious among the feathered tribe. The Toucan, the Spoonbill, the Pelican, the Dodo, and others, certainly claim the attention of the naturalist ; but in my humble opinion the Brefga has merits far superior, on the ground of rarity. The largest beak I ever saw was produced from a bird shot at a place called Kullar, about nine miles from Mivituapore. The following is the measurement:

| Length of the beak in a straight line from its junc- |
| :--- |
| tion with the head |
| Length of the horn from the base to the point |
| Depth of the whole beak, including the horn, near |
| The horn to its junction with the upper mandible |
| Each mandible in the centre of the beak - |
| Distance from the point of the horn to the point of the beak |
| Dis |
| $\frac{\frac{1}{4}}{\frac{1}{4}}$ |

It may be proper to observe here, that the beak forms a much greater curve than the horn, the point
of which is parallel to its junction with the beak; whereas the point of the beak comes down an inch and a quarter below the lower mandible. The following is the measurement of the bird to which this beak belonged.
Length from the forchead to the tip of the tail
Circumference in the thickest part
Neck, from the chin to the shoulder
Body, from the shoulder to the rump
Tail, from the rump to the point
Height and breadth of the head
Circumference of the neck in the middile
Length of the wing, when closed
Dition when open
Extent when expanded from tip to tip
Length of the legs -
Ditto of the toes
Ditto of the claws, largest
Circumierence of the legs

I have to regret that I did not weigh this bird: indeed at the time I had no idea that I should attempt the description of it ; I can only therefore venture to guess that it might weigh about six or seven pounds. I took a drawing of the bird, which has enabled me to give the above account.

I endeavoured to acquire some information from the bird-catchers respecting the use of the horn, upon the idea that nature forms nothing in vain; but all that I could learn was unsatisfactory, and amounted to little more than this: one of the beaks was brought
to me with the horn very much worn at the point, which they told me proceeded from the birds striking it against the trees; but for what particular purpose they so applied it, they could give no clear account.

But what may be probably deemed the most extraordinary circumstance relating to this curious bird, is its feeding upon the Nux vomica. This is a point which I have been able clearly to ascertain. One of these birds, purchased by Capt. John Campbell, was opened, by his orders, before several respectable gentlemen at Midmepore; and in its craw were found several seeds of the Nux romica. With respect to my own observation, I have had only one opportunity of seeing the contents of the craw, which was that of the bird shot at Kullar. Nothing was found in it but the remains of an egg, and some weeds: bur to carry on the enquiry, that I might be able safely to assert what appeared to me a circumstance of great curiosity, I asked the bird-catchers what these birds fed upon. They very particularly mentioned a fruir called Coochla. Agreeably to my directions, they brought it to me. It was about the size of a lime, of an orange colour, with a very hard skin, shining and almost smooth: it contained a pulpous substance, distinct and separate from the shell. Conversing since with a man who had been in Major Crawford's corps at Jelda, who had seen great numbers of these birds in the surrounding hilly country, I enquired of - him what they fed upon. He said, sometimes upon the berry of the Pcepul-tree; but that the food they at-

## 128

 ON THE DHANE'SA,fected most, and with which they were most delighted, was the Coochlu; which he said was to be had in every bazar: He brought me some of it. It proved to be the true Nux romica; which, from an account given to me by a native, is produced from the fruit abovementioned. The pulpous substance drying, leaves one, two, and sometimes three of the flat seeds, which are known as the Nuic romica: and this agrees with the account given of it by Casper Neuman in his Chemical Works; who says, "Nux vomica, so called, " is not a nut, but the seed of a fruit, like an orange, "growing in the East Inclies." The tree whick. produces the Coochla, abounds in the range of western hills before mentioned : it varies in its size; sometimes attains to a considerable heighth; has a leaf nearly shaped like a heart. It appears from what I have said, that these birds feed not only upon the seed, when it has arrived at a state of maturity, but that they also eat it in the state it was brought to me by the birdcatchers; and, that when the Coochla is not to be had, they resort to other food. These biids, at particular seasons, grôw very fat; and this season appears to be when the fruit of the Nour vomica prevails; about the month of December. The one before mentioned, shot at Kullar, was killed in that month, and was very fat. The natives make use of the far, and also of the flesh and bones, as a medicine. They apply both species to this purpose. The cases they use it in are, in the contractions, which sometimes proceed from catching cold afier the profuse use of mercury: it is applied to alleviate and remove violent pains,
that often succeed venereal complaints, called by the natives Cuttea ke Azar: it is also used by the natives, in very cold weather, when the pores of the skin are affected; for, being in its nature extremely hot, in this case it causes a free perspiration. The Burgma is preferred to the Putleal, as being deemed more efficacious. The mode they apply it in is this: they reduce the fat to an cintment, at the same time mixing with it every kind of spice, pepper, cloves, cardamums, $\delta c$. the flesh is also mixed in the same manner. The ointment is rubbed into the part affected every night when they go to sleep, and a certain portion of the meat is eaten in the morning rising: the gall is also used by the native women in cases of sterility. They take it either infused in water, or mix it with their Pawns; and of the efficacy of this they have the firmest reliance under Providence. I enquired of the person who gave me this account, whether he had ever knowin any one who had been benefitted by this medicine: he told me that he was acquainted with a man who had used it in contractions of his limbs, and that this person declared he had derived great adrantage from the application. At any rate, it is certainly an opinion generally adopted by the natives, that it is of great use in the cases I have mentioned, With every one with whom I have conversed, the medicinal properties of this extraordinary bird are held in the highest estimation; they speak of it with a degiee of admiartion bordering on enthusiasm. Thus I have cndeavoured, from the slight ability I possessed, to bring forward to public notice
VoL.IV. K one
one of the most curious birds I have ever seen or heard of. Some allowance, I trust, will be made, from the consideration that this is my first essay: perhaps I should never have made the attempt but from having taken a drawing of the bird, and having heard of its feeding upon the Nux vomica: these circumstances induced me to give the ahove account. Wolf, in his description of Ceylon, has the following words: " a very rare species too of cock is found " here, called Double-billed: this has a white double "bill, which is almost as large as the bird itself." It is by no means improbable that this may be the same bird which I have given an account of: the beak of the Basima Dunnase, particulanly when in the act of flying, appears to be as large as the bird itself; the depth in measurement is nearly the same. It is impossible to form any reasonable conjecture :especting the use of the horn: that some it must have, may naturally be supposed; but what, must be left to the future investigation of some one whose situation will afford him full opportunity of making the inquiry : it is certainly an object worthy of attention; more particularly so, as tending to clucidate the wisdom of the Supreme Being, who undoubtedly creates nothing in vain.

## REMARK BY THE PRESIDENT.

Though the genus of the Dhane'sa be already known to our naturalists by the appellations of Buceros, Calao, and Hornbill; and though even the sevetai species be distinguished, I believe, with exactness,
yet we are obliged to Lieut. White for a complete description of so extraordinary a bird, and for our knowledge of the singular facts which he first made public. The hollow protuberance at the base of the upper mandible, has been supposed, with reason, by Count Gika, to serve as a receptacle for nourishment ; and the natives, I find, consider it as a natural cistern to supply the bird with water in the dry stason, and on its long excursions; whence the name of Dhanésa, or Lord of Wealth, may possibly have been given to it. The Count had been informed that it was no other than the Garuda of Indian Mythologists; but the Pandits unanimously assure me, that, by the word Garuda, they mean in common discourse the Gridhra, or King of Ioultures; and they have a curious legend of a young Garuda, or Eagle, who burned his wings by soaring too near the sun, on which he had fixed his eyes. The bird of Vishne is in fact wholly mythological ; and I have seen it painted in the form of a boy with an Eagle's plamage. As to the Cuchita (for so is the word written and correctly pronounced) it is, no doubt, the Strychnos Nien vomica or Colubrina, for they are now thought specifically the same. The leaves and fruit of both the varieties were brought to me by a Bráhmen as those of the Cuchilit, and he repeated a Sunscrit verse, in which it was called IJanastája, or King of the Forest: but, according to an approved comment on the Amaracósh, it has four other names, amongst which Culaca is the smoothest; so that the first true species of this genus may be named Str icanos Culaca, and the second Strychasos Catacu;
by which denomination it is mentioned in the Laws of Menu, where allusion is made to the Indian practice of clearing water, by bruising one of the seeds, and casting it into the jar, where, says Koenig, all impurities are in a few moments precipitated, and the water becomes perfectly limpid.

## ISLANDS NANCOWRY AND COMARTY.

BYY LIEUT. R. H. COLEBROOKE.

THE island of Nancorery, or Soury, as it is sometimes called, is nearly centrically situated among the Nirobar isles. Its length may be about eight miles, and its breadth nearly equal. The island of Comarty, which is near it, is more extensive, but does not perhaps contain more solid land, being excavated by a very large bay from the sea. The space between these two islands forms a capacious and excellent harbour, the eastern entrance of which is sheltered by another island, called Trikut, lying at the distance of about a league. The inlet from the west is narrow, but sufficiently deep to admit the largest ships when the wind is fair.

The Danes have long maintained a small settlement at this place, which stands on the northernmost point of Nancowry, within the harbour. A ser-

jeant and three or four soldiers, a few black slaves, and two rusty old pieces of ordnance, compose the whole of their establishment. They have here two houses, one of which, built entirely of wood, is their habitation; the other, formerly inhabited by their missionaries, serves now for a storehouse.

These islands are in general woody, but contain likewise some portions of clear land. From the summits of their hills the prospects are often beautiful and romantic. The soil is rich, and probably capable of producing all the various fruits and vegetables common to hot climates. The natural productions of this kind, which mostly abound, are cocoa-nuts, papias, plantains, limes, tamarinds, beetle-nuts, and the melóri ${ }^{\text {* }}$, a species of breadfruit; yams, and other roots, are cultivated and thrive ; but rice is here unknown. The mangostain-tree, whose fruit is so justly extolled, grows wild; and pine-apples of a delicious flavour are found in the woods.

The Nicobar isles are but thinly inhabited, and some of them are not inhabited at all. Of those we visited, Nancowry and Comarty appeared to be the best peopled. There were thirteen villages, we were told, upon both islands ; each village might contain, upon an averase, fifty or sixty people; so that the whole population of these two will scarcely amount to eight hundred.

The natives of Nancowy, and of the Nicobar islands in general, live on the sea-shores, and never

[^8]erect their habitations inland ${ }^{*}$. Their houses are of a circular form, and are covered with elliptical domes, thatched with grass and the leaves of cocoa-nut. They are raised upon piles to the height of six or eight feet above the ground ; the floor and sides are laid with planks, and the ascent is by a ladder. In those bays or inlcts which are sheltered from the surf, they erect then somctimes so near the margin of the water as to admit the tide to flow under, and wash away the ordure from below.

Is front of their villages, and a little advanced in the water, they plant beacons of a great height, which they adorn with tufts made of grass, or the bark of some tree. These objects are discernible at a great distance, and arc intended probably for landimarks; their houses, which are overshadowed by thick groves of cocoa-nut trees, seldom being visible from afar.

The Nicobareans, though indoient, are in general robust and well limbed. Their features are somewhat like the Malays, and their colour is nearly similar. The women are much inferior in stature to the men, but more active in all domestic affairs. Contrary to the custom of other natives, they shave the hair of their heads, or keep it close cropt, which gives them an uncouth appearance, in the eyes of strangers at least. The dress of borh sexes, their mode of life, and some of their customs, have been so ably described by Mr. Fontana, that little needs to be

[^9]said of them here. I have only to state, in addition, an extraordinary ceremony which they annually perform, in honour of the dead.

On the anniversary of this festival, if it can be so called, their houses are decorated with garlands of flowers, fruits, and branches of trees. The people of each village assemble, drest in their best attire, at the principal house in the place, where they spend the day in a convivial manner; the men, sitting apart from the women, smoke tobacco and infoxicate themselves; while the latter are nursing their children and employed in preparations for the mournful business of the night. At a certain hour of the afternoon, announced by striking the Goung *, the women set up the most dismal howls and lamentations, which they continue without intermission till about sun-set; when the whole party get up, and walk in procession to the burying-ground. Arrived at the place, they form a circle around one of the graves, when a stake, planted exactly over the head of the corpse, is pulled up. The woman who is nearest of kin to the deceased, steps out from the crowd, digs up the skull, $\underset{\sim}{\gamma}$ and draws it up with her hands. At sight of the bones, her strength seems to fail her ; she shrieks, she sobs; and tears of anguish abundantly fall on the mouldering object of her pious care. She clears it from the earth, scrapes

* An instrument of brass, somewhat like the Griry of Bengal. Its sound is more hollow.
$\dagger$ We were present at the ceremony on the ist of February; ${ }^{1790}$, when the first skull we saw was that of a woman, who had been buried but a few months before. It was then dug up for the first time by her daughter. This office, we are told, is always performed by the women, whichever sex the skull belongs to. A man in a fantassic garb officiates as priest.
off the festering flesh, and laves it plentifully with the milk of fresh cocoa-nuts, supplied by the bystanders; after which she rubs it over with an infusion of saffron, and wraps it carefully in a piece of new cloth. It is then deposited again in the earth, and covered up; the stake is replanted, and hiung with the various trap:pings and implements belonging to the deceased. They proceed then to the other graves; and the whole night is spent in repetitions of these dismal and disgustful rites.

On the morning following, the ceremony is concluded by an offering of many fat swine; when the sacrifice made to the dead affords an ample:feast to the living : they besmear themselves with the blood of the slaughtered hogs, and some, more voracious than others, eat the flesh raw. They have various ways however of dressing their meat, but always eat it without salt. A kind of paste made of the melori, servés them for bread; and they finish their repast with copious potations of taniry.

The Nicobareans are hospitable and honest, and are remarkable for a strict observance of truth, and for punctuality in adhering to their engagements. Such crimes as theft, robbery, and murder, are unknown in these islands; but they do not want spirit to revenge their injuries, and will fight resolutely and slay their enemies, if attacked or unjustly dealt with.*

* We were informed, that a party of Malays had once landed at Nancowry, to commit depredations, and were cut off to a man by the enraged inhabitants. A similar instance of their vengeance is said to have happened at the island Carnicobar, when they put to death some sailors who were plundering their houses, and probably attempting to violate their women.

NANCOWRY AND COMARTE.

Their only vice, if this failing can be so called, is inebriation; but in their cups they are generally jovial and good-humoured. It sometimes however happens at their feasts, that the men of different villages fall out; and the quarrel immediately becomes general. In these cases they terminate their differenecs in a pitched battle, where the only weapons used are long sticks, of a hard and knotty wood. With these they drub one another most heartily, till, no longer able to endure the confict, they mutually put a stop to the combat, and all get drunk again.

ONTHE

## LORIE, OR SLOW-PACED LEMUR.

## BY THE PRESIDENT.

THE singular animal, which most of you saw alive, and of which I now lay before you a perfectly accurate figure, has been very correctly described by Linnetes; except that sickled would have been a juster epithet than aroled for the bent clazes on its hinder indices; and that the size of a squirrel seems an improper, because a variable measure: its configuration and colours are particularized also with great accuracy by M. Daubenton ; but the short atcount of the Loris, by M. De Buffon, appears unsatisfac-
$13^{8}$ ON THELOKIS,
tory, and his engraved representation of it has littie resemblance to nature; so little that, when I was endeavouring to find in his work a description of the quadrumane which had just been sent me from Dacca, I passed over the chapter on the Loris, and ascertained it merely by seeing in a note the Linnean character of the slow-paced Lemur. The illustrious French naturalist, whom, even when we criticise a few parts of his noble work, we cannot but name with admiration, observes of the Loris, that, from the proportion of its body and limbs, one wiould not suppose it slow in walking or leaping, and intimates an opinion, that Seba gave this animal the epithet of slow-moting, from some fancied likeness to the Sloth of America: but, though its body be remarkably long in proportion to the breadth of it, and the hinder legs, or more properly arms, much longer than those before, yet the Loris, in fact, walks or climbs very slowly, and is, probably, unable to leap. Neither its genus nor species, we find, are new : yet, as its temper and instincts are undescribed, and as the Natural History by M. De Buf--fon, or the System of Nature by Linneevs, cannot always be readily procured, I have set down a few remarks on the form, the manners, the name, and the country of my little favourite, who engaged my affection while he lived, and whose memory I wish to perpetuate.
I. This male animal had four hands, each fivefingered; palms naked; nails round, except those of the indices behind, which were long, curv-
ed, pointed; hair very thick, especially on the haunches, extremely soft, mostly dark grey, varied above with brown and a tinge of russet; darker on the back, paler about the face and under the thront, reddish towards the rump; no tail, a dorsal stripe, broad, chesnut-coloured, narrower towards the neck ; a head almost spherical; a countenance expressive and interesting; eyes round, large, approximated, weak in the day-time, glowing and animated at niglit ; a white vertical stripe between them ; eye-lashes blacik, short ; ears dark, rounded, concave; great acuteness at night, both in seeing and hearing; a face hairy, flatish; a nose pointed, not much elongated ; the upper lip cleft; canine-teeth, comparatively long, very sharp.

More than this I could not observe on the living animal; and he died at a season when I could neither attend a dissection of his body, nor with propriety request any of my medical friends to perform such an operation during the heats of August; but I opened his jaw and counted only two incisors above, and as many below, which might have been a defect in the individual ; and it is mentioned simply as a fact, without any intention to censure the generic arrangement of Liñeus.
II. In his manners he was for the most part gentle, except in the cold season, when his temper seemed wholly changed; and his Creator, who made him so sensible of cold, to which he must often have been exposed even in his native forests, gave him?, probably for that reason his thick fur, which we tarely
see on animals in these tropical climates. To me, who not only constantly fed him, but bathed him twice a week in water accommodated to the seasons, and whom he clearly distinguished from others, he was at all times grateful ; but, when I disturbed him in winter, he was usually indignant, and seemed to reproach me with the uncasiness which he felt, though no possible precautions had been omitted to keep him in a proper degree of warmith. At all times he was pleased with being stroked on the head and throat, and frequently suffered me to totich his extremely sharp teeth ; but at all times his temper was quick, and, when he was unseasonably disturbed, he expressed a little resentment by an obscure murmur, like that of a squirrel, or a greater degree of displeasure by a peevish cry, especially in winter, when he was often as fierce on being much importuned, as any beast of the woods. From half an hour after sunrise to half an hour before sunset, he slept without intermission, rolled up like a hedge-hog; and as soon as he awoke, he began to prepare himself for the labours of his approaching day, licking and dressing himself like a cat: an operation which the flexibility of his neck and limbs enabled him to perform very completely; he was then ready for a slight breakfast, after which he commonly took a short nap; but when the sun was quite set, he recovered all his vivacity. His ordinary food was the sweet fruit of his country; plantains always, and mangos during the season; but he refused peaches, and was not fond of mulberries, or even of guaiavas; milk he lapped eagerly, but was contented with plain
water. In general he was not voracious, but never appeared satiated with grasshoppers; and passed the whole night, while the hot season lasted, in prowling for them. When a grasshopper, or any insect, alighted within his reach, his eyes, which he fixed on his prey, glowed with uncommon fire ; and, having drawn himself back to spring on it with greater force, he seized the victim with both his fore-paws, but held it in one of them while he devoured it. For other purposes, and sometimes even for that of holding his food, he used all his paws indifferently as hands, and frequently grasped with one of them the higher part of his ample cage, while his three others were severally engaged at the bottom of it; but the posture of which he seemed fondest, was to cling with all four of them to the upper wires, his body being inverted; and in the evening he usually stood erect for many minutes playing on the wires with his fingers, and rapidly moving his body from side to side, as if he had found the utility of exercise in his unnatural state of confinement. A little before day-break, when my early hours gave me frequent opportunities of observing him, he seemed to solicit my attention ; and if I presented my finger to him, he licked or nibbled it with great gentleness, but eagerly took fruit when I offered it; though he seldom eat much at his morning repast. When the day brought back his night, his eyes lost their lustie and strength, and he composed himself for a slumber of ten or eleven hours.
III. The names Loris and Lemur will, no doubt, be continued by the respective disciples of Buffon
and Linneus; nor can I suggest any other, since the Pandits know little or nothing of the animal. The lower Hindus of this province generally call it Lajjábinar, or the Bashful Ape; and the Muselmans, retaining the sense of the epithet, give it the absurd appellation of a Cat ; but it is neither a cat nor bashful; for though a Pandit, who saw my Lemur by day-light, remarked that he was Lajjalu, or moidest (a word which the Hindus apply to all sensitiou plants) yet he only seemed bashful, while in fact he was dimsighted and drowsy ; for at night, as you perceive by his figure, he had open eyes, and as much boldness as any of the Lemures poetical or Linncean.
IV. As to his country, the first of the species that I saw in India was in the district of Tipra, properly Tripure, whither it had been brought, like mine, from the Garrore mountains; and Dr. Anderson informs me, that it is found in the woods on the coast of Coromandel. Another had been sent to a member of our society from one of the eastern isles; and tho' the Loris may be also a native of Silin, yet I cannot agree with M. De Buffon, that it is the minute, sociable, and docile animal mentioned by Thevenot, which it resembles neither in size nor in disposition.

My little friend was, on the whole, very engaging; and when he was found lifeless, in the same posture in which he would naturally have siept, I consoled myself with believing that he had died without pain, and lived with as much pleasure as he could have cnjoyed in a state of captivity.

# ASTRONOMICAL OBSERVATIOAS 

MADEIN THE

UPPER PARTS OF HINDOSTA'N, AND

ON A JOURNEY THENCE TO OUJEIN.

> BY WILLIAM HUNTER, ESQ.

BEFORE delivering the following observations, it will be proper to give some account of the instruments with which they are made. The altitudes for determining latitudes and time, were taken with a sextant of ten inches radius, made by Troughton: the limb is divided into degrees and thirds of a degree, and the divisions on the vernier go to half minutes; so that, by the help of the magnifying lens, a difference of ten seconds is sufficiently perceptible. The two specula, being screwed down in their places, do not (as far as I can discover) admit of the principal or vertical adjustment : but the error was almost daily ascertained by the double mensuration of the sun's diameter, and constantly allowed for. It is subtractive ; and my determination of its quantity varied from $2^{\prime} 30^{\prime \prime}$ to $3^{\prime} 30^{\prime \prime}$. These differences may have in part arisen from a real variation in the quantity of this correction; but I ascribe them chiefly to some inaccuracy in my mensuration of the sun's diameter. To form some judgment of the influence this cause might
might have, I have examined twenty-three of those measurments, madc between the 7 th of Mdrch and the 7 th of June (being all of which I have any record) by taking the medium of the sun's diameters, as measured on the limb, to the right and left of zero, and comparing it with the diameter for that day, as laid down in the Ephemeris. It will appear, from a list of those observations, that my measurements commonly exceeded those given in the Ephemeris; but the greatest excess was $25^{\prime \prime}$.

Vol. IV.
L
These

These mensurations may have a farther use, besides ascertaining the adjustment of the quadrant. If the eye could determine, with perfect accuracy, the contact of the limbs, the mean between the two measurements of the sun's diameter would be exactly equal to his apparent diameter, as determined by calculation, and given in the Ephemeris; but, from the imperfection of our organs, it happens that the limbs will sometimes appear to be in contact, when a little space remains between them; at others, when they overlap one another: in the former case, the diameter, will appear greater; in the latter, less than the truth. But it is probable that, at nearly the same period of time, the state of the eye, or of the sensorium, by which we judge of this contact, is, in the same person, nearly the same. Of this I have made some trials, and found, that, when the sun's diameter, by my mensuration, differed from that in the Ephemeris, on repeating the mensurations, at short intervals, the difference remained nearly the same. ' Therefore, if we observe the sun's altitude, a little time before or after measuring his diameter, the contact of the limbs will, probably, appear to take place in the same real situation of those limbs as when we measured the sun's diameter. But here, the effect of too open or too close observation will be reversed; the former making the altitude appear less; the latter, greater than the truth. These measurements then may be applied as corrections of the observed altitude. Thus, if the diameter of the sum has appeared too great, add the quantity of its exa:
cess to the angle observed, between the sun and his image in Mrocury; if it appeared too small, subtract the defert, to give the true angle. Thus, March the ${ }^{1} 3^{\text {ch }}$, the error of the sextant was $2^{\prime} 52^{\prime \prime}$ to be subtracted; but the measurement of the sun's diameter exceeds the truth by $24^{\prime \prime}$. Therefore, this quantity is to be added to the observed angle, the observation being, probably, so much too open.

The angle between the sun and his image in quickGilver, that day at noon, was

$$
123^{\circ} 33^{\prime} 45^{\prime \prime}
$$

Error Sextant - $2^{\prime} 52^{\prime \prime}$
Do. Observation +024

- Diff.

2) $123 \quad 31 \quad 17$

Diff. refr. and parallax

which is $13^{\prime \prime}$ less than in the following list, where this error was not allowed for.

The secondary, or horizontal adjustment, made by a small screw at the fore-part of the little speculum, was, from time to time, carefully attended to.

 ASTRONOMICAL OBSERVATIONSThe altitudes were taken by means of the image in quicksilver, which, if the sun was the object, was defended from the wind by a covering of thin gauze, as recummended by Mr. Burrow in the first volume of the Asiatic Researches. When the altitude of a s:ar was to be taken, this method did not answer, as it rendered the image too obscure. A thick cloth was therefore properly disposed to windward of the mercury.

Tire small telescope belonging to the sextant was used in all the observations.

As the instrument is only graduated to 125 degrees, I coilld not take altitudes exceeding 62 degrees. While the sun's meridian altitude could be observed, I have preferred it for the latitude; but, as this was soon about to be impracticable, I began, on the 29 th of February, to compare the latitudes by meridian altitude, with those obtained from two altitudes and the elapsed time, by the rule in the requisite tables, in order to judge how far the latter might be depended on. The result of the comparison, which appears in the observations from that time to the 15 th of March, determined me to trust to those double altitudes, while they could be taken within the prescribed limits; at the same time, comparing them occasionally with observations by a fixed star. From the first of April, 1 was obliged to trust entirely to the stars; and, to make the observations by them as accurate as possible, I have, when circumstances would allow, taken the meridian altitude of one to the north, and another to the
south, of the zenith. The telescope is an achromatic, made by Dolland, of twenty-eight inches focal distance. It inverts the object, and magnifies eighty times.

The watch is made by Brookbank, with horizon balance wheel, and continues to go while winding up. To determine, as accurately as possible, the time of an observation, I took equal aititudes of the sun, on the days preceding and following it, and, having thus found the quantity gained or lost in twenty-four hours, applied to the time of observation a part proportional to its distance from the preceding or following noon. In this calculation, allowance was made for the difference of longitude (ascertained by geometrical surveys) if the altitudes on the two days were taken at different places. Besides this I have, when I had the opportunity, taken the altitudes of two fixed stars, one to the east, and another to the west of the meridian, within an hour before or after the observation, and calculated the time from them.

eclipses of juplter's Satellites. [continued.]

Not having the opportunity of comparing these observations with contenporary ones taken at Grecnevich, or at places the longitudes
of which from that observatory are ascertained, I have considered the times of the Eclipses siven in the Epbencris as accurate, and
thence deduced the longitude from Grecnevich.

I5 ASTRONOMICAL OBSERVATIONS, \&C.

## REMARK BY THE PRESIDENT.

The observations, with which Mr. Hunter has favoured us, will be a valuable acquisition to all Indian gcographers and antiquaries; for since Ujjayini, or Ujjein, is in the first meridian of the Hindus, its longitude ascertains the position of Lanca on the equator, and fixes the longitude, at least according to the Hindu astronomers, of Curucshétra, F'atsa, the Pool Sannihita Cánchí, and other places, which are frequently celebrated in Sanscrit books of the highest antiquity. Hence also we shall possibly ascertain the seven droipas, which, on the authority of $\mathrm{Pa}_{\mathrm{A}}$ tanjali and of the Véda itself, we may pronounce to be neither the sewen planets nor the seven climates, but great peninsulas of this earth, or large tracts of land with water on both sides of them. For cxample, in a preface to the Surya Siddthinta, the peninsula, called Sálmala, is declared to be 422 Y'ijanas to the east of Lancie; now a true Yójana is equal to $4^{\frac{T}{4}}$ geomerrical miles; and the longitude of Sálmala will thus bring us to the Guiph of Siam, or to the eastern Indian peninsula beyond Malacca. There is a passage in one of the Puránas, which confrms this argument; where king Sravana is described " on the TVhite Mountain in the extensive region of "Sálmaladwipu, meditating on the traces of the " divine foot, at a place called the slation of $\operatorname{Tr} \mathrm{I}$ "vicrama." Now we are assured by credible travellers, that the Siamese boast of a rock in thelr country, on which a footstep, as they say, of Vishinu is clearly discernible.

# QUESTIONS AND REMARKS <br> ON THE <br> ASTRONOMY OF THE HINDLS. 

BY JOHN PLAYFAIR, A. M.
PROEESSOR OF MATHEMIATICS, ATEDINBURGK.

WRITTEN IOTH OF OCTOBER, I Y92。

PRESUMING on the invitation given with so much liberality in the Adrertisement prefixed to the second rolume of the Asiatic Researches, I have ventured to submit the following queries and observations to the President and other Members of the learned Society in Bengal.
1.

Are any Books to be found among the Hindus, eebich treat professedly of Geometry?

I Am led to propose this question, by having observed, not only that the whole of the Indiun As. tronomy is a system constructed with great geometrical skill, but that the trigonometrical rules, given in the translation from the Sirya Siddlianta, with which

Mr. Davis has obliged the world, point out some very curious theorems, which must have been known to the author of that ancient book. The rule, for instance, by which the trigonometrical canon of the Hindu astronomers is constructed *, involves in it the following theorem: "If there be three arches of a "s circle in arithmetical progression, the sum of the ss sines of the two extreme arches is to twice the sine "s of the middle arch, as the co-sine of the common " difference of the arches to the radius of the circle. Now this theorem, though not difficult to be demonstrated, is yet so far from obvious, that it seems not known to the mathematicians of Europe till the beginning of the last century, when it was discovered by Vieta. It has ever since been used for the construction of trigonometrical tables, as it affords a method of calculating the sines and arches much easier than that which depends on successive extracions of the square root. To find that this theorem was known to the Brámens many ages ago, is therefore extremely curious; and the more so, because there is some reason to think that the commentator on the Siddhanta, quoted and translated by Mr. Davis $\dot{\gamma}$, did not understand the principle of this rule, since the method which he lays down is entirely different, much less profound in theory, and much more difficult in practice. If this be true, it indicates a retrograde order in the progrees of eastern science, which must have had its origin in a very remote age.

[^10]II. Are
II.

Are any books of Hindu Aritbmetice to be procured?

It should seem, that if such books exist, they must contain much curious information, with many abridgments in the labour of calculating; and the like; all which may be reasonably expected from them, since an arithmetical notation, so perfect as that of Inclia, has existed in that country much longer than in any other; but that which most of all seems to deserve the attention of the learned, is, the discovery said to be made of something like Algebra among the Hindus; such as the expression of number in general by certain symbols, and the idea of negative quantities. These certainly cannot be too carefully enquired into ; and will, it is hoped, be considered by the Society at Calculta as a part of that rich mine from which they have already extracted so thany taluable materials. The problem mentioned by Mr. Burrow * proves, that the IIinduis have turned their attention to certain arithmetical investigations, of which there is no trace in the writings of the Greek mathèmaticians.

## III.

Must not a complete tranislation of the Su'rya Siddha'nta be considered as the grand desideratum with respect to Indian Astronomy?

$$
\text { * }=\text { Asiat. Res. } 495 .
$$

Sir W. Jones gives us reason, I think, to hope that this will be executed by Mr. Davis; and the specimen which that gentleman has exhibited, leaves as little reason to doubt of his abilities to translate the work accurately, as of the great value of the original: I have therefore only to express a wish, that if there be any diagrams in the Súrya Siddhánta, they may be carefully preserved.
IV.

Wo uld not a Catalogue Raisonne', containing an emumeration, and a sbort account of the Sanscrit books on Indian Astronomy, be a work bighbly interesting and useful?

## V.

Might not an actual examination of the beavens, in company with a Hindu Astronomer, to ascertain all the stars and constellations, for which there are names in Sanscrit, prove a most valuable addition to our knowledge of Indian Astronomy?

Let me here take the liberty of reminding the. President of his promise to make such an examination; by which the mistakes concerning the Indian Zodiac, some of which he has already pointed out, may be decisively corrected.

> VI. Moy

THE ASTRONOMY OF THE HINDUS. 163 VI.

May it not be of consequence to procure descripvions of the principal astronomical buildings and instruments of whick any remains are still to be found, and wbich are certainly known to be of Hindu origin?

Under this head I would comprehend not only such works as the Observatory at Benares, which is well described by Sir Robert Barker, but also such instruments as the Astrolabe, mentioned by Mr. Burrow in the Appendix to the second volume of the Asiatic Researches; and engravings of such instruments will be necessary to accompany the descriptions.

Though, in the preceding questions, there may be nothing that has escaped the attention of the Society in Bengal, yet they will, perhaps, be forgiven to one who feels himself deeply interested in the subject to which they relate, and who would not lose even the feeblest ray of a light, which, without the exertions of the Asiatic Society, must perish for ever.

## REMARK BY THE PRESIDENT.

We shall concur, I am persuaded, in giving our public thanks to Professor Playfair for the Questions which he has proposed; and in expressing our wish, that his example may be followed by the learned in Europe. Concise answers to his queries will be given in my next annual discourse; the subject of which will comprise a general accourt of Indian $\mathrm{M}_{2}$

164 UUUESTIONS AND REMARKS, -ZZC. astronomy and mathematics. I would long ago have accomplished my design (which I never meant as a promise to be performed in all,events) of examining the havens in company with an intelligent Hindu astronomer, if such a companion could have been found in this province : but, though I offered ample stipends to any Hindu astronomer who could name, in Sanscrit, all the constellations which 1 should point out; and to any Hindu physician who could bring me all the plants named in Sanscrit books, I was assured by the Brahmen whom 1 had commisioned to search for such instructors, that no Pandit in Bengal even pretended to possess the knowledge which I required. Lieut. Wilforid, however, has lately favoured me with a Sanscrit work, procured by him at Benares, containing the names, figures, and positions of all the asterisms known to ancient or modern Hindus, not only in the Zodiac, but in both hemspheres, and almost from pole to pole. That work I translated with attention, and immediately consigned it to Mr. Davis, who, of all men living, is the best qualified to exhibit a copious and accurate History of Indian Astronomy,

# DISCOURSE THE ELEVENTH. 

ON THE

## PHILOSOPHY OF THE ASIATICS.

Delivered 201h of February, 179 \&.

BY THE PRESIDENT.

HAD it been of any importance, Gentlemen, to arrange these Anniversary Dissertations according to the ordinary progress of the human mind, in the gradual expansion of its three most considerable powers, memory, imagination, and reason, I should certainly have presented you with an cssay on the liberal arts of the five Asiatic nations, before I produced my remarks on their abstract sciences; because, from my own observation at least, it seems evident, that fancy, or the faculty of combining our ideas agreeably, by various modes of imitation and substitution, is in general earlier exercised, and sooner attains maturity than the power of separating and comparing those ideas by the laborious exertions of intellect; and hence, I believe, it has happened, that all nations in the world had poets before they had mere philosophers: but, as M. D'Alembert has deliberately placed science before art, as the question of prece-
dence is, on this occasion, of no moment whatever, and as many new facts on the subject of Asiatic Philosophy are fresh in my remembrance, I propose to address you now on the sciences of Asia, reserving for our next annual meeting a disquisition concerning those fine arts which have immemorially been cultivated, with different success, and in very different modes, within the circle of our common inquiries.

By science I mean an assemblage of transcendental propositions discoverable by human reason, and reducible to first principles, axioms, or maxims, from which they may all be derived in a regular succession; and there are consequently as many sciences as there are general objects of our intellectual powers. When man first exerts those powers, his objects are himself and the rest of nature. Himself he perceives to be composed of bocly and mind; and in his individual capacity he reasons on the uses of his animal frame and of its parts, both exterior and internal ; on the discrders impeding the regular functions of those parts, and on the most probable methods of preventing those disorders, or of removing them; he soon feels the close connexion between his corporeal and mental faculties; and when his mind is reflected on itself, he discourses on its essence and its operations: in his social character, he analyzes his various. duties and rights, both private and public; and in the leisure which the fullest discharge of those duties always admits, his intellect is directed to nature at large, ta the substance of natural bodies, to their several pro-
perties, and to their quantity both separate and united, finite and infinite; from all which objects he deduces notions, either purely abstract and universal, or mixed with undoubted facts; he argues from phenomena to theorems, from those theorems to other phenomena; from causes to effects, from effects to causes, and thus arrives at the demonstration of a first intelligent couse: whence his collected wisdom, being arranged in the form of science, chiefly consists of physiology and medicine, metaphysics and logic, ethics and jurisprudence, natural philosophy and mathematics; from which the religion of nature (since revealed religion must be referred to history, as alone affording evidence of it) has in all ages and in all nations been the sublime and consoling result. Without professing to have given a logical definition of science, or to have exhibited a perfect enumeration of its objects, I shall confine myself to those five divisions of Asiatic Philosophy; enlarging for the most part on the progress which the Hindus have made in them, and occasionally introducing the sciences of the Arabs and Persians, the Tartars and the Chinese: but, how extensive soever may be the range which I have chosen, I shall beware of exhausting your patience with tedious discussions, and of exceeding those limits which the occasion of our present meeting has necessarily prescribed.
I. The first article affords little scope; since I have no evidence that, in any language of $A$ sia, there exists one original treatise on medicine considered
as a science: physic, indeed; appears in these regions to have been from time immemorial, as we see it practised at this day by Hindus and Muselmans, a mere empirical history of diseases and remedies; useful I admit, in a high degree, and worthy of attentive examination, but wholly forcign to the subject before us. Though the Arabs, however, have chiefly followed the Grecks in this branch of knowledge, and have themselves been implicitly followed by other Mohammedan, writers, yet (not to mention the Chinese, of whose medical works $I$ can at present say nothing with confidence) we still have access to a number of Sanscrit books on the old Indian practice of physic, from which, if the IInudus had a theoretical system, we might easily collect it. The Ayurvida, supposed to be the work of a celestial physician, is almost entirely lost, unfortunately, perlaps, for the curious European, but happily for the patient Hindu; since a revealed science precludes improvement from experience, to which that of medicine ought, above all others, to be left perpetually open: but I have myself met with curious fragments of that primeval work; and, in the V'cia itself, I found with astonishment an entire Upanishad on the internal parts of the human body; with an enumeration of nerves, veins, and arteries; a description of the heart, splean, and liver; and various disquisitions on the formation and growth of the foctus. From the laws, indeed, of Mexu, which have lately appeared in our own language, we may perceive that he ancient Hindus were fond of reasoning, in their
way, on the mysteries of animal generation, and on the comparative influence of the sexes in the production of perfect offspring; and we may collect from the authorities adduced in the learned Essay on Egypt and the Nile, that their physiological disputes led to violent schisms in religion, and even to bloody wars. On the whole, we cannot expect to acquire many raluable truths from an examination of eastern books on the science of medicine ; but examine them we must, if we wish to complete the history of universal philosophy, and to supply the scholars of Europe with authentic materials for an account of the opinions anciently formed on this head by the philosophers of Asia. To know indeed, with certainty, that so much and no more can be known on any branch of science, would in itself be very important and useful knowledge, if it had no other effect than to check the boundless curiosity of mankind, and to fix them in the straight path of attainable science, especially of such as relates to their duties, and may conduce to their happiness.
II. We have an ample field in the next division, and a field almost wholly new, since the mytaphysics and logic of the Brámens, comprised in their six philosophical Sistras, and explained by numerous glosses, or comments, have never yet been accessible to Europeans; and, by the help of the Scunserit language, we now may read the works of the Saugralus, Bauddhas, A'rlutius, Juinas, and other heterodos philosophers, whence we may gather the metaphysical tenets prevalent in Chima and Japan, in the
castern peninsula of India, and in many considerable nations of Tartary. There are also some valuable tracts on these branches of science in Persian and Arabic, partly copied from the Greeks, and partly comprising the doctrines of the Suffis, which anciently prevailed, and still prevail in a great measure over this oriental world; and which the Greeks themselves condescended to borrow from eastern sages.

The little treatise in four chapters, ascribed to $V_{y i s a}$, is the only philosophical Sástra, the original text of which I have had leisure to peruse with a Brabmen of the V'danti school: it is extremcly obscure, and though composed in sentences elegantly modulated, has more resemblance to a able of contents, or an accurate summary, than to a regular systematical tract; but all its obscurity has been cleared by the labour of the very judicious and most leamed Sancara, whose commentary on the Fedanta which I read also with great attention, not only clucidates every word of the text, but exhibits a perspicuous account of all other Indiun schools, from that of Capila to those of the more modern heretics. It is not possible, indeed, to speak with too much applause of so excellent a work; and I am confident in asserting, that, until an accurate translation of it shall appear in some European language, the general history of philosophy must remain incomplete; for I perfectly agree with those wha are of opinion, that one correct version of any celebrated IInclu book would be of greater value than all the dissertations or essays that could be composed on
the same subject. You will not, however, expect that, in such a discourse as I am now delivering, [ should expatiate on the diversity of Indian philosophical schools, on the several founders of them, on the doctrines which they respectively taught, or on their many disciples, who dissented from their instructors in some particular points. On the present occasion, it will be sufficient to say, that the oldest head of a sect, whose entire work is preserved, was (according to some authors) CAPILA ; not the divine personage, a reputed grandson of $\mathrm{Brahma}^{\prime}$, to whom Cri'shna compares himself in the Gíti; but a sage of his name, who invented the Sanchyy, or Numeral philosophy, which Crishna himself appears to impugn in his conversation with Arjuna; and which, as far as I can collect it from a few original texts, resembled in part the metaphysics of Pythagoras, and in part the theology of $\mathbf{Z}_{\text {eno. }}$ His doctrines were enforced and illustrated, with some additions, by the venerable Patanjali, who has also left us a fine comment on the grammatical rules of Pa'nini, which are more obscure, without a gloss, than the darkest oracle; and here, by the way, let me add, that I refer to metaphysics the curious and important science of universal grammar, on which many subtil disquisitions may be found interspersed in the particular grammars of the ancient Hindus, and in those of the more modern Arabs. The next founder, I believe, of a philosophical school was Go'tama; if, indced, he was not the most ancient of all; for his wife Ahai ya' was, according to Indian legends,
restored to a haman shape by the great RA'ma; and a sage of his name, whom we have no reason to suppose a different personage, is frequently mentioned in the Fécla itself: to his rational doctrines those of CANA'DA were in general conformable ; and the philosophy of them both is usually called Nyáya, or logical: a title aptly bestowed; for it seems to be a system of metaphysics and logic better accommodated than any other anciently known in India, to the natural reason and common sense of mankind,' admitting the actual existence of material substance in the popular acceptation of the word matter; and comprising not only a hody of sublime dialectics, but an artificial method of reasoning, with distinct names for the three parts of a proposition, and even for those of a regular syllogism. Here I cannot refrain from introducing a singular tradition, which prevailed, according to the well-informed author of the Datistam, in the Panjib and in several Persian provinces; that, "among other Indian curiosities, " which CAllis'thenses iransmited to his uncle, *was a becimical system of logic, which the Bralmens " had communicated to the incuisitive Greek," and which the Mohammedun writer supposes to bave been the ground work of the famous Arislollean mothod. If this be truc, it is one of the most interesting facts that I have met with in Asia: and if it be false, it is very extraordinary that such a story should have been fabricated cither by the candid Monsana Fomi, or by the simple Parsis and Pandits, with whom he had conversed; but, not having had leisure to study
the Nyána Sistric, I can only assure you, that I have frequently seen perfect syllogisms in the philosophical writings of the Brahinero, and have often heard them used in their verbal controversies. Whatever might have been the merit or age of Go'tama, yet the most celebrated Indian schiool is that, with which I began, founded by $\mathrm{VrA}_{\mathrm{A}}$ s. , and supported in most respects by his pupil Jaminin, whose dissent on a few points is mentioned by his master with respectful moderation : their several systems are frequently distinguished by the names of the first and 'second Miminsi' ; a word which, like Nyáya, denotes the operations and conclusions of reason; but the tract of $V_{Y A} \wedge^{s}$ has in general the appellation of $V$ ' 3 --dantr, or the scope and end of the $V$ cida; on the texts of which, as they were understood by the philosopher who collected them, his doctrines are principaily grounded. The fundamental tenet of the Fédintí school, to which in a more modern age the incomparable Sancara was a firm and illustrious adherent, consisted not in denying the existence of matter, that is, of solidity, impenetrability, and extended figure (to deny which would be lunacy) but, in correcting the popular notion of it, and in contending that it has no essence independent of mental perception ; that existence and perceptibility are conveitible terms ; that external appearances and sensations are illusory, and would vanish into nothing, if the divine energy, which alone sustains them, were suspended but for a moment: an opinion, which Eprcharmus and Plato secm to have adopted, and
which has been maintained in the present century with great elegance, but with little public applause ; partly because it has been misunderstood, and partly because it has been misapplied by the false reasoning of some unpopular writers, who are said to have disbelieved in the moral attributes of GoD, whose omnipresence, wisdom, and goodness, are the basis of the Indian philosophy. I have not sufficient evidence on the subject to profess a belief in the doctrine of the V'dánta, which human reason alone could, perhaps, neither fully demonstrate, nor fully disprove; but it is manifest, that nothing can be farther removed from impiety than a system wholly built on the purest decotion; and the inexpressible difficulty which any man, who shall make the attempt, will assuredly find in giving a satisfactory definition of material substance, must induce us to deliberate with coolness, before we censure the leanned and pious restorer of the ancient Vida; though we cannot but admit, that, if the common opinions of mankind be the criterion of philosophical truth, we must adhere to the system of Go'tama, which the Brámens of this province almost universally follow.

If the metaphysics of the lédunt's be wild and erroneous, the pupils of Beddha have run, it is asserted, into an error diametrically opposite; for they are charged with denying the existence of pure spinit, and with beliering nothing absolutely and really to exist but material substance: a heavy accusation which ought only to have been made oa positive
and incontestible proof, especially by the orthodox Brinmens, who, as Buddha dissented from their ancestors in regard to bloody sacrifices, which the Védu certainly prescribes, may not unjustly be suspected of low and interested malignity. Though I cannot credit the charge, yet I am unable to prove it entirely false, having only read a few pages of a Suugata book, which Captain Kirkpatrick had lately the kindness to give me ; but it begins like other Hinds books, with the word $O m$, which we know to be a symbol of the divine attributes; then follows, indeed, a mysterious hymn to the Goddess of Nature by the name of $\mathcal{A}^{\prime} r y a ́$, but with several other titles, which the Braimmens themselves, continually bestow on their Divi. Now the Brihmens, who have no idea that any such personage exists as $D E^{\prime} \mathrm{vi}^{\prime}$, or the Goiddess, and only mean to express allegorically the pozer of GoD, exerted in creating, preserving, and renorating this universe, we cannot with justice infer, that the dissenters admit no Deity but visibla nature. The Pandit who now attends me, and who told Mr. Wilifins that the Saugatas were atheists, would not have attempted to resist the decisive evidence of the contrary, which appears in the very instrument on which he was consulted, if his understanding had not been blinded by the intolerant zeal of a mercenary priesthood. A literal version of the book just mentioned (if any studious man had learning and industry equal to the task) would be an inestimable treasure to the compiler of such a history as that of the laborious Brtcerer. But let us procced
to the morals and jurisprudence of the Asialics, on which I could expatiate, if the occasion admitted a full discussion of the subject, with correctness and confidence.
III. That both ethics and abstract law. might be reduced to the method of science, cannot surely be doubted; but, although such a method would be of infinite use in a system of universal, or even of national jurisprudence, yet the principles of morality are so few, so luminous, and so ready to present themselves on every occasion, that the practical utility of a scientifical arrangement, in a treatise on ethics, may very justly be questioned. The moralists of the east have, in general, chosen to deliver their precepts in short sententious maxims, to illustrate them by sprightly comparisons, or to inculcate them in the very ancient form of agreeable apologues. There are indeed, both in Arabic and Persian, philosophical tracts on ethics, written with sound ratiocinution and elegant perspicuity; but in every part of this eastern world, from P'ekin to Damascus, the popular teachers of moral wisdom have immemorially been poets, and there would be no end of enumerating their works, which are still extant in the five principal languages of $A$ sia. Our divine religion, the truth of which (if any history be true) is abundantly proved by historical evidence, has no need of such aids, as many are willing to give it, by assertting, that the wisest men of this world were ignorant of the two great maxims, that we must act in respect of others, as we should wish them to act in respect of ourselves,
selves, and that, instead of returning evil for evil, we should confer benefits even on those who injure us: but the first rule is implied in a speech of LYSIAS; and expressed in distinct phrases by Thales and PitTACUS; and I have even seen it, word for word, in the original of Confucius, which I carefully compared with the Latin translation. It has been usual with zealous men to ridicule and abuse all those who dare on this point to quote the Chinese philosopher ; but, instead of supporting their cause they would shake it, if it could be shaken, by their uncandid asperity; for they ought to remember, that one great end of revelation, as it is most expressly declared, was not to instruct the wise and few, but the many and unenlightened. If the conversion, therefore, of the Pandits and Maulavis in this country shall ever be attempted by Protestant missionaries, they must beware of asserting, while they teach the gospel of truth, what those Pandits and Maulavis would know to be false. The former would cite the beautiful A'ryá couplet, which was written at least three centuries before our æra, and which pronounces the duty of a good man, even in the nioment of his destruction, to consist not only in forgiving, but even in a desire of benefitting, his destroyer, as the Sandal tree, in the instant of its overthrow, sheds perfume on the axe which fells it; and the latter would triumph in repeating the verse of SADI, who represents a return of good for good as a slight reciprocity; but says to the virtnous man, "Confer benefits on him who has injurred thee;" using an Arabic sentence, and a maxim apparently of the

Vol. IV.
N
ancient
ancient Arabs. Nor would the Muselmans fail to recite four distichs of $\mathrm{HA}^{\prime} \mathrm{FIz}$, who has illustrated that maxim with fanciful but elegant allusions :

Learn from yon orient shell to love thy foe,
And store with pearls the hand that brings thee woe:
Free, like yon rock, from base vindictive pride,
Emblaze with gems the wrist that rends thy side:
Mark, where yon tree rewards, the stony show's'
With fruit nectareous, or the balmy flow'r:
All nature calls aloud; "sball man do less
"Than beal the switer, and the railer bless?"
Now there is not a shadow of reason for believing that the poet of Shiraz had borrowed this doctrine from the Christians; but, as the cause of Christianity could never be promoted by falsehood or error, so it will never be obstructed by candour and veracity; for the lessons of Confucius and Chanacya, of SADI and HA'Fiz, are unknown even at this day to millions of Chinese and Hindus, Persians and other Mahommedans, who toil for their daily support; nor, were they known ever so perfectly, would they have a divine sanction with the multitude; so that, in order to enlighten the minds of the ignorant, and to enforce the obedience of the perverse, it is evident, a priori, that a revealed religion was necessary in the great system of Providence: but my principal motive for introducing this topic, was to give you a a. specimen of that ancient oriental morality which is comprised in an infinite number of Persian, Arabic, and Sanscrit compositions.

Neariy one half of jurisprudence is closely con-
nected with ethics; but, since the learned of Asia consider most of their laws as positive and divine institutions, and not as the mere conclusions of human reason; and since I have prepared a mass of extremely curious materials which I reserve for an introduction to the digest of Indian laws, I proceed to the fourth division; which consists principally of science, transcendently so named, or the knowoledge of abstract quanlities, of their limits, properties, and relations, impressed on the understanding with the force of irresistible demonstration; which, as all other knowledge depends, at best, on our fallible senses, and in a great measure on still more fallible testimony, can only be found in pure mental abstractions ; though for all the purposes of life our own senses, and even the credible testimony of others, give us in most cases the highest degree of certainty, physical and moral.
IV. I have already had occasion to touch on the Indian metaphysics of natural bodies according to the most celebrated of the Asiatic schools, from which the Pythagoreans are supposed to have borrowed many of their opinions; and, as we learn from Cicero, that the old sages of Europe had an idea of centripetal force, and a principle of universal gravitation (which they never indeed attempted to demonstrate) so I can venture to affirm, without meaning to pluck a leaf from the never fading laurels of our immortal Newton, that the whole of his theology, and part of his philosophy, may be found in the $V^{\prime}$ das, and even in the works of the Sufis. That most subtil spirit, which he suspected to pervade natural
bodies, and, lying concealed in them, to cause at. traction and repulsion ; the emission, reflection, and refraction of light ; ceectricity, calcfaction, sensation, and muscular motion, is described. by the Hindus as a fifth element, endued with those very powers; and the Védas abound with allusions to a force universally attractive, which they chiefly ascribe to the Sun, thence called Aditya, or the Attractor: a name designed by the mythologists to mean the Child of the Goddess AditI ; but the most wonderful passage on the theory of attraction, oceurs in the charming allegorical poem of Shíri'n and Ferha'd, or the Divine Spirit and a Inman soul disinterestedly pious: a work which, from the first verse to the last, is a blaze of religious and poetical fire. The whole passage appears to me so curious, that I make no apology for giving you a faithful translation of it: ". There is a strong propensity which dances through " every atom, and attracts the minutest particle to " some peculiar object. Search this universe from " its base to its summit, from fire to air, from water "to earth, from all below the Moon to all above " the celestial spheres, and thou wilt not find a cor" puscle destitute of that natural attractability; the " very point of the first thread, in this apparently "t tangled skein, is no other than such a principle of " attraction; and all principles beside are woid of " a real basis: from such a propensity arises every " motion perceived in heavenly, or in terrestrial " bodies: it is a disposition to be attracted, whick " taught hard steel to rusti from its place and rivet
" itself on the magnet: it is the same disposition "s which impels the light straw to attach itself firmly " on amber: it is this quality which gives every "substance in nature a tendency toward another, " and an inclination forcibly directed to a determi" nate point." These notions are vague, indeed, and unsatisfactory ; but permit me to ask, whecher the last paragraph of Newron's incomparable work goes much farther, and whether any subsequent experiments have thrown light on a subject so abstruse and obscure. That the sublime astronomy and exquisitely beautiful geometry with which that work is illumined, should in any degree be approached by the Mathematicians of Asia, while of all Europeans who ever lived, Archimedes alone was capable of emulating them, would be a vain expectation; but we must suspend our opinion of $\ln$ ditan astronomical knowledge, till the Surya Siddhinta shall appear 'in our own language, and even then (to adopt a phrase of Cicero) our greedy and capacious ears will by no means be satisfied; for, in order to complete an historical account of genuine Hinillu astronomy, we require verbal translations of at least three other Sanscrit books; of the treatise of Parasara for the first age of Indian science ; of that by Vara'ha, with the copious comment of his very learned son, for the middle age; and of those written by Bнascara for times comparatively modern. The valuable and now accessible works of the last mentioned philosopher, contain also an universal, or specious arithaetic, with one chapter at least in geo-
metry; nor, would it, surely, be difficult to procure, through our several residents with the Pishzoid and with Scindiya, the older books on algebra, which Bhascara mentions, and on which Mr. Davis -would justly set a very high value; but the Sanscrit work, from which we might expect the most ample and important information, is entitled Cshétrádersa, or a View of Geometrical Knowledge, and was compiled in a very large volume by order of the illustrious Jayasinha, comprising all that remains on that science in the sacred language of India: it was inspected in the west by a Pandit now in the service of Lieutenant Wilford, and might, I am persuaded, be purchased at Jayanagar, where Colonel Polier had permission from the Rája to buy the four Vedas themselves. Thus have I answered, to the best of my power, the three first questions obligingly transmitted to us by Professor Playfair, - Whether the Hindus have books in Sanscrit expressly on geometry? Whether they have any such on arithmetic? and. Whether a translation of the Sírya Siddhánta be not the great desideratum on the subject of Indian astronomy? To his three last questions, - Whether an accurate summary account of all the Sanscrit works on that subject? A delineation of the Indian celestial sphere, wih correct remarks on it? and, A description of the astronomical instruments used by the àncient Hindus, would not severally be of great utility? we cannot but answer in the affirmative, provided that the utmost critical sagacity were applied in distinguisbing such works, constellations,
constellations, and instruments; as are clearly of Indian origin, from such as were introduced into this country by Muselman astronomers from Tartary and Persia, or in later days by mathematicians from Europe.
V. From all the propertics of man and of nature, from all the various branches of science, from all the deductions of human reason, the general corollary, admitted by Hindus, Arabs, and Tartars, by Persians, and by Chinese, is the supremacy of an allcreating and all-preserving Spirit, infinitely wise, good, and powerful, but infinitely removed from the comprehension of his most exalted creatures; nor are there in any language (the ancient Hebrew always excepted) more pious and sublime addresses to the Being of beings, more splendid enumerations of his attributes, or more beautiful descriptions of his visible works, than in Arabic, Persian, and Sanscrit, especially in the Koran, the introductions of the poems of Sadi', Niza'mi', and Firdaus'i, the four Vèdás and many parts of the numerous Purrinas: but supplication and praise would not satisfy the boundless imagination of the Vedántì and Süfì theologists, who, blending uncertain metaphysics with undoubted principles of religion, have presumed to reason confidently on the very nature and essence of the divine spirit, and asserted in a very remote age, what multitudes of Hindus and Musselmans assert at this hour, that all spirit is homogeneous; that the spirit of Gon is in kind the same with that of man, though differing from it infinitely in degree;
and that, as material substance is mere illusion, there exists in this universe only one generic spiritual substance, the sole primary cause, efficient, substantial, and formal of all secondary causes and of all appearances whatever, but endued, in its highest degree, with a sublime providential wisdom, and proceeding by ways incomprehensible to, the spirits which emane from it: an opinion which Gótama never taught, and which we have no authority to believe, but which, as it is grounded on the doctrine of an immaterial Creator supremely wise, and a constant Preserver supremely benevolent, differs as widely from the pantheism of Sprinoza and Toland as the affirmation of a proposition differs from the negation of it; though the lastnamed professor of that insane philosophy had the baseness to ccnceal his meaning under the very words of Saint Paul, which are cited by Newton for a purpose totally different, and has even used a phrase which occurs, indeed, in the Vèda, but in a sense diametrically opposite to that which he would have given it. The passage to which I allude, is in a speech of Varuna to his son, where he says, "That spirit, from which these created " beings proceed; through which, having proceeded " from it, they live; toward which they tend, and " in which they are ultimately absorbed, that spirit " study to know ; that spirit is the Great One."

The subject of this discourse, Gentlemen, is inexhaustible: it has been my endeavour to say as much on it as possible in the fewest words; and, at the beginning of next year, I hope to close these
general disquisitions with topics measureless in extent, but less abstruse than that which has this day been discussed; and better adapted to the gaiety which seems to have prevailed in the learned banquets of the Greeks, and which ought surely to prevail in every symposiac assembly.

## A DISCOURSE

DELIVERED AT
a meeting of the asiatic society, on the 22d of may, 1794.

BY SIR JOHN SHORE, BART. PRESIDENT.

IF I had consulted my competency only, for the station which your choice has conferred upon me, 1 must, without hesitation, have declined the honour of being the President of this Society ; and although I most cheerfully accept your invitation, with every inclination to assist, as far as my abilities extend, in promoting the laudable views of our association, I must still retain the consciousness of those disqualifications, which you have been pleased to overlook.

Ir was lately our boast to possess a President, whose

186
whose name, talents, and character, would have been honourable to any institution; it is now our misfortune to lament, that Sir William Jones exists but in the affections of his friends, and in the esteem, veneration, and regret of all.

I cannot, I flatter myself, offer a more grateful tribute to the Society, than by making his character the subject of my first address to you; and if in the delineation of it, fondness or affection for the man should appear blended with my reverence for his genius and abilities, in the sympathy of your feelings I shall find my apology.

To define, with accuracy, the variety, value, and extent of his literary attainments, requires more learning than I pretend to possess; and I am therefore to solicit your indulgence for an imperfect sketch, rather than expect your approbation for a complete description, of the talents and knowledge of your late and lamented President.

I shall begin with mentioning his wonderful capacity for the acquisition of languages, which has never been excelled. In Greek and Roman literature, his early proficiency was the subject of admiration and applause, and knowledge of whatever nature, oncé obtained by him, was ever afterwards progressive. The more elegant dialects of modern Europe, the French, the Spanish, and the Italian, he spoke and wrote with the greatest fluency and precision; and the German and Portuguese were familiar to him. At an early period of life his application to oriental literature commenced: he studied the Hebrew with ease and success; and many of the most
learned Asiatics have the candour to avow, that his knowledge of Arabic and Persian, was as accurate and extensive as their own; he was also conversant in the Turkish idiom ; and the Chinese had even attracted his notice so far, as to induce him to learn the radical characters of that language, with a view perhaps to farther improvements. It was to be expected, after his arrival in India, that he would eagerly embrace the opportunity of making himself master of the Shanscrit ; and the most enlightened professors of the doctrines of Brahma, confess, with pride, delight, and surprize, that his knowledge of their sacred dialect was most critically correct and profound. The Pandits, who were in the habit of attending him, when I saw them after his death, at a public Durbar, could neither suppress their tears for his loss, nor find terms to express their admiration at the wonderful progress he had made in their sciences.

Before the expiration of his twenty-second year, he had completed his Commentaries on the Poetry of the Asiatics, although a considerable time afterwards elapsed before their publication; and this work, if no other monument of his labours existed, would at once furnish proofs of his consummate skill in the oriental dialccts, of his proficiency in those of Rome and Greece, of taste and crudition far beyond his years, and of talents and application without example.

But the judgment of Sir William Jones was too discerning to consider language in any other light than as the key of science; and he would have despised the reputation of a mere linguist. Knowledge

## 188

and truth were the objects of all his studies, and his ambition was to be useful to mankind. With these views, he extended his researches to all languages, nations, and times.

Such were the motives that induced him to propose to the Government of this country, what he justly denominated a work of national utility and importance ; the compilation of a copious Digest of Hindu and Mahommedan Law, from Shanscrit and Arabic originals, with an offer of his services to superintend the compilation, and with a promise to translate it. He had foreseen, previous to his departure from Europe, that without the aid of such a work, the wise and benevolent intentions of the legislature of Great Britain, in leaving, to a certain extent, the natives of these provinces in possession of their own laws, could not be completely fulfilled; and his experience, after a short residence in India, confirmed what his sagacity had anticipated, that without principles to refer to, in a language familiar to the judges of the courts, adjudications amongst the natives must too often be subject to an uncertain and erroneous exposition, or wilful misinterpretation of their laws.
To the superintendence of this work, which was inmeriately undertaken at his suggestion, he assiduously devoted those hours which he could spare from his professional duties. After tracing the plan of the digest, he prescribed its arrangement and mode of execution, and selected from the most learnod Hindus and Mahommedans fit persons for the task of compiling it. Flattered by his attention, and encouraged
faged by his applause, the Pandits prosecuted their labours with cheerful zeal, to a satisfactory conclusion. The Molurees have also nearly finished their portion of the work; but we must ever regret that the promised translation, as well as the meditated preliminary dissertation, have been frustrated by that decree which so ofien intercepts the performance of human purposes.

During the course of this compilation, and as an auxiliary to it, he was led to study the works of Menu, reputed by the Hindus to be the oldest and holiest of legislators; and finding them to comprize a system of religious and civil duties, and of law in all its branches, so comprehensive and minutely exact, that it might be considered as the institutes of Hindu law, he presented a translation of them to the Government of Bengal. During the same period, deeming no labour excessive or superfluous that tended, in any respect, to promote the welfare or happiness of mankind, he gave the public an English version of the Aralic text of the Sirajiyyah, or Mahommedan Law of Inheritance, with a Commentary. He had aiready published in England, a translation of a Tract on the same subject, by another Makommedan lawyer, containing, as his own words express, a lively and elegant epitome of the Law of Inheritance, according to Zaid.

To these learned and important works, so far out of the road of amusement, nothing could have engaged his application, but that desire which he ever professed, of rendering his knowledge useful to his own nation, and beneficial to the inhabitants of these provinces.

$$
W_{\ddagger} \text { THOUT? }
$$

Without attending to the chronological order of their publication, I shall briefly recapitulate his other performances in Asiatic Literature, as far as my knowledge and recollection of them extend.

The vanity and petulance of Anquetil du Perron, with his illiberal reflections on some of the learned Members of the University of Oxford, extorted from him a letter in the French language, which has been admired for accurate criticism, just satire, and elegant composition. A regard for the literary reputation of his country, induced him to translate from a. Persian original into French, the Life of Nadir Shah, that it might not be carricd out of England, with a reflection that no person had been found in the British dominions capable of translating it. The students of Persian literature must ever be grateful to him for a grammar of that language, in which he has shewn the possibility of combining taste and elegance with the precision of a grammarian; and every admirer of Arabir poetry must acknowledge his obligations to him for an English version of the seven celebrated poems, so well known by the name of Moallakut, from the distinction to which their excellence had entitled them. of being suspended in the temple of Mecca. I should scarcely think it of importance to mention, that he did not disdain the office of Editor of a Shansorit and Persian work, if it did not afford me an opportunity of adding, that the latter was published at his own expence, and was sold for the benefit of insolvent debtors. A similar application was made of the produce of the Sirajificim.
$\mathrm{Of}_{\mathrm{f}}$ his lighter productions, the elegant amusements of his leisure hours, comprehending hymns on the Hindu mythology; poems, consisting chiefly of translations from the Asiatic languages; and the version of Sacontala, and ancient Indian drama, it would be unbecoming to speak in a style of importance which he did not himself annex to them. They shew the activity of a vigorous mind, its fertility, its genius, and its taste. Nor shall I particularly dwell on the discourses addressed to this Society, which we have all perused or heard, or on the other learned and interesting dissertations, which form so large and valuable a portion of the records of our researches, let us lament that the spirit which dictated them is to us extinct; and that the voice to which we listened with improvement and rapture, will be heard by us no more.

But I cannor pass over a paper, which has fallen into my possession since his demise, in the handwriting of Sir William Jones himself, entited Destderata, as more explanatory than any thing I can say of the comprehensive views of his enlightened mind. It contains, as a perusal of it will shew, whatever is most curious, important, and attainable, in the sciences and histories of India, Arabia, China, and Tartary; subjects which he had aleady most amply discussed in the disquisitions which he laid before the Society.

## TARTARY. XXIII.

A History of the Tartar Nations, chiefly of the Mooruls and Othmans; from the Turkish and Persian.

We are not authorized to conclude that he had himself formed a determination to complete the works which his genius and knowledge had thus sketched; the task seems to require a period beyond the probable duration of any human life; but we who had the happiness to know Sir William Jones, who were witnesses of his indefatigable perseverance in the pursuit of knowledge, and of his ardour to accomplish whatever he deemed important, who saw the extent of his intellectual powers, his wonderful attainments in literature and science, and the facility with which all his compositions were made, cannot doubt, if it Lad pleased Providence to protract the date of his existence, that he would have ably executed much of what he had so extensively planned.

I have hitherto principally confined my discourse to the pursuits of our late President, in oriental literature, which, from their extent, might appear to have occupied all his time ; bot they neithier precluded his attention to professional studies, nor to science in general. Amongst his publications in Europe, in polite literature, exclusive of various composition's in prose and verse, I find a translation of the Speeches of IS IE US, with a learned comment; and in law, an Essay on the Law of Bailments. Upon the subject of this last work, I cannot deny myself the gratification of quoting the sentiment of a celebrated historian :"Sir Wileiam Jones has given an ingenious and " rational Essay on the Law of Bailments. He is per" haps the only lawyer equally conversant with the " year-books of Westminster, the Commentaries of " Ulpian, the Attic Pleadings of Iseus, and the "Sentences of Arabian and Persion Cadhis."
His professional studies did not commence before his twenty-second year ; and 1 have his own authority for asserting, that the first book of English jurisprudence which he ever studied, was Fortescue's Essay, in Praise of the Laws of England.
Of the ability and conscientious integrity with which he discharged the functions of a Magistrate, and the duties of a Judge of the Supreme Court of Judicature, in this settlement, the public voice and public regret bear ample and merited testimony. The same pene: tration which marked his scientific researches, distinguished his legal investigations and decisions; and he deemed no enquiries burthensome which had for their object substantial justice under the rules of law.

His ardaresses to the jurors are no less distinguished for philanthropy and liberality of sentiment, than for just expositions of the law, perspicuity and elegance of diction ; and his oratory was as captivating as his arguments were convincing.

In an epilogue to his Commentaries on Asiatic Poetry, he bids farewell to polite literature, without relinquishing his affection for it; and concludes with an intimation of his intention to study law, expressed in a wish which we now know to have been prophetic.

> Mihi sit oro, non inutilis toga,

Nec indisserla lingua, nec turpis manus!
I have already enumerated attainments and works which, from their diversity and extent, seem far beyond the capacity of the most enlarged minds; but the catalogue may yet be augmented. To a proficiency in the languages of Greece, Rome, and Asia, he added the knowledge of the philosophy of those countries, and of every thing curious and valuable that had been taught in them. The doctrines of the Academy, the Lyceum, or the Portico, were not more familiar to him than the tenets of the Védus, the mysticism of the Sufis, or the religion of the ancient Persians; and whilst with a kindred genius he perused with rapture the heroic, lyric, or moral compositions of the most renowned poets of Greece, Rome, and Asia, he could turn with equal delight and knowledge to the sublime speculations, or mathematical calculations of BARRow and Newton. With them also he professed his conviction of the truth of the Christian religion; and he justly deemed it no inconsiderable advantage that his researches had corroborated the multiplied evidence
evidence of revelation, by confirming the Mosaic account of the primitive world. We all recollect, and can refer to the following sentiments in his Eighth Anniversary Discourse.
" Theological inquiries are no part of my pre" sent subject; but I cannot refrain from adding, " that the collection of tracts, which we call from " their excellence the Scriptures, contain, independ" ently of a divine origin, more true sublimity, " more exquisite beauty, purer morality, more im" portant history, and finer strains both of poetry and " eloquence, than could be collected within the same " compass from all other books that were ever com" posed in any age, or in any idiom. The two " parts, of which the scriptures consist, are connected " by a chain of compositions, which bear no resem" blance in form or style to any that can be produced " from the stores of Grecian, Indian, Persian, or even "Arabian learning. The antiquity of those compo" sitions no man doubts, and the unrestrained appli"cation of them to events long subsequent to their " publication, is a solid ground of belief that they " were genuine predictions, and consequently inspired."

There were, in truth, few sciences in which he had not acquired considerable proficiency; in most his knowledge was profound. The theory of music was familiar to him, nor had he neglected to make himself acquainted with the interesting discoveries lately made in Chemistry; and I have heard him assert, that his admiration of the structure of the human frame, had induced him to attend for a season to a course of ana:omical lectures, delivered by his friend the celebrated Hunter.

His last and favourire pursuit was the study of Botany, which he originally began under the confinement of a severe and lingering disorder; which, with most minds, would have proved a disqualification from any application. It constituted the principal amusement of his leisure hours. In the arrangements of Linnees he discovered system, truth, and science, which never failed to captivate and engage his attention; and from the proofs which he has exhibited of his progress in Botany, we may conclude that he would have extended the discoveries in that science. The last composition which he read in this Society, was a description of select Indian plants; and I hope his Executors will allow us to fulfil his intention of publishing it in a number of our Researches.

It cannot be deemed useless or. superfluous to enquire, by what arts or method he was enabled to attain to a degree of knowledge, almost universal, and appaiently beyond the powers of man, during a life little exceeding forty-seven years.

Tine faculties of his mind, by nature vigorous, were improved by constant exercise ; and his memory, by habitual practice, had acquired a capacity of retaining whatever had once been impressed upon it. To an unextinguished ardour for universal knowledge, he joined a perseverance in the pursuit of it, which subdued all obstacles; his studies began with the dawn, and, during the intermissions of professional duties, were continued throughout the day: reflection and meditation strengthened and confirmed whiat induscry and investigation had accumulated. If was a fixed principle with him, from which he
never voluntarily deviated; not to be deterred by any difficulties that were surmountable, from prosecuting to a successful termination what he had once deli; berately undertaken.

But what appears to me more particularly to have enabled him to employ his talents so much to his own and the public advantage, was the regular allorment of his time to particular occupations, and a scrupulous adherence to the distribution which he had fixed ; hence, all his studies were pursued without interruption or confusion : nor can I here omit remarking, what may probably have attracted your observation as well as mine, the candour and complacency with which he gave his attention to all persons, of whatever quality, talents, or education: he justly concluded that curious or important information might be gained even from the illiterate ; and wherever it was to be obtained, he sought and seized it.

Of the private and social virtues of our lamented President, our hearts are the best records. To jous who knew him, it cannot be necessary for me to expatiate on the independence of his integrity, his humanity, probity, or benevolence, which every living creature participated ; on the affability of his conversation and manners, or his modest unassuming deportment; nor need I remark that he was totally free from pedantry, as well as from arrogance and self-sufficiency, which sometimes accompany and disgrace the greatest abilities : his presence was the delight of every society, which his conversation exhilarated and im1proved; and the public have not only to lament the loss of his talents and abilities, but that of his example.

To him, as the Founder of our Institution, and whilst he lived its firmest support, our reverence is more particularly due : instructed, animated, and encouraged by him, genius was called forth into exertion, and modest merit was excited to distinguish itself. Anxious for the reputation of the Society, he was indefatigable in his own endeavours to promote it, whilst he cheerfully assisted those of others. In losing him, we have not only been deprived of our brightest ornament, but of a guide and patron, on whose instructions, judgment, and candour, we could implicitly rely.

But it will, I trust, be long, very long, before the remembrance of his virtues, his genius, and abilities, lose that influence over the Members of this Society which his living example had maintained; and if, previous to his demise, he had been asked, by what posthumous honours or attentions we could best shew our respect for his memory, I may venture to assert he would have replied, "by exerting yourselves to support the credit of the Society;" applying to it, perhaps, the dying wish of Father PAUL, "Esto perpetua."
?

A SYNOPSIS OF THE DICINAL AND SEPTENARY CHANGES OF THE BAROMETER.

A

## TREATISE ON THE BAROMETER.

BY FRANCIS BALFOUR, ESQ.

## I.

IN a Treatise, published at this place a few weeks ago, on Sol-Lunar Influence in Fevers, I have endeavoured to shew, "That all Fevers are liable to certain diurnal and septenary * revolutions; and that these revolutions are uniformly and constantly connected with fixed periods of time.

> II.

Having established this proposition (r.), it was natural to suppose that the power or influence which is capable of producing these very remarkable and interesting revolutions on the human constitution, at certain intervals, did not exert itself without effecting, at the same time, some corresponding periodical change in the state of that element in which we constantly exist ; and in which all the operations of life and nature are carried on.

Other necessary avocations having hitherto prevented me from being able to make those experiments myself that are required for deciding on this

* That is to say, changes happening after an interval of seven or eight days.
question, I applied to Mr. Farquhar, who, I understood, had paid some attention to this subject ; and was favoured with the following very obliging and instructive letter :

## TO DOCTOR BALFOUR.

DEARSIR,
" You likewise desire me to give you some account of the regular diurnal variations of the Barometer which take place in this country ; and which, I said, I conceived to be peculiar to tropical climates, from the otherwise unaccountable silence of every author whose work I had been able to consult on the subject. The first intimation of this was from Mr. Henry Trail, who informed me that he had observed the Nercury to rise every night till about cleven o'clock, when it became stationary. I immediately repeated his observations, and found that the fact was certain ; but that there was likewise another diurnal variation, which had escaped his notice. After numerous observations, at all hours during the day and night, I found that the Mercury is subject to the following variations, with the utmost degree of regularity, throughout the whole year. Fiom six in the morning till between seven and eight, it is stationary; it then rises till nine, sometimes, though rarcly, till ten, when it remains stationary till noon; it then descends, and is lowest at three, and continues stationary till eight; when it begins to rise, and continues till eleven, and is then at the same height that it was at nine in the morning.

O:s relating the above observations to the late Co lonel Pearce, an indefatigable and rigidly accurate observer, and who had devoted much time and attention to Barometrical pursuits, he was surprised that such regular variations of the Mercury should have escaped his observation : but some time after, with great candour acknowledged the certainty of the fact, and framed an hypothesis to account for it; which you will probably be able to obtain on an application to Captain Grace.
To me the phenomena appear inexplicable to any hypothesis that I can think of. The periocis are evidently connected with the earth's diurnal motion ; and, if we had not a satellite, might be easily explained by the atmospherial tides caused by the sun. But when we find that the Barometer is not, in the least observable degree, affected by the moon's passage over the meridian, or by the united action of the sun and moon at the syzygies, we have absolute proof that this cannot be the cause; neither can the expansion of the Mercury, being directly opposite to the phenomena, the greatest degree of heat taking place at three o'clock, when the Mercury is lowest.
. With respect to the influence of the moon on the atmosphere, I was perfectly satisfied while in Beerlooon, that the cold season set in at the syzygies only; and that there was always a considerable increase of cold at every return of them. But at the old powder-works near Calcilta, I observed the greatest degree of cold to happen sometimes at the quadratures. Being, however, at that time much engaged in other pursuits, I did not attend to the circumstance of the moon's
alsolute distance, though of the utmost consequence in all calculations of the heights of the tide, to which the variations of the state of the atmosphere, occasioned by the attraction of the sun and moon, must be analogous. And yet this fact, important as it is to every sea-faring person, especially in river-navigations, as well as to ship-builders, for predicting the highest spring-tides, secms to be totally unknown to the generality of these persons; nor is it surprising, as it is not taken notice of in any treatise on navigation that I have met with. But M. De la Lande (Astronomy, vol. iii. p. $65^{6}$.) shews, that if the moon's mean force to raise the waters of the ocean be two and a half, her greatest force when Apogee, will be three; and her least when Perigee, two : a difference sufficient to account for the tides at the quadratures being sometimes nearly as high as those at the syzygies: a circumstance which was ascertained by part of a committee instituted for examining plans for new powder-works at the Old Fort Ghaut; where stakes had been driven, on purpose to find the rise of the tide. M. De la Lande confirms the theory by many observations, made with great accuracy in some of the ports of France (Supplement, vol. iv.); and I can vouch for the fact by numerous measures of the heights of the tide, bath at the old and new powder-works. But you may easily satisfy yourself of the fact, by observing the height of a few tides at Champaul Ghaut, when you will find, invariably, that every great parallax of the moon, at the syzygies, is attended with a very high tide and strong bore; and vic: versa. I have not been able to observe
that the moon's declination, notwithstanding what you may have heard from other quarters, has any perceptible effect on the tides.

I have been the more particular on this subject, as I have heard it made an unanswerable objection to your system, that the first attacks of intermittent tever do happen at the quadratures as well as the syzygies; and that relapses do likewise happen at the quadratures. Now, should you meet with any such cases, the above observations may perhaps tend to reconcile them to your system, \&c.

John Farquhar.
Banky Bazar, 12 th Feb. 1794.

## III.

Although in this leter Mr. Farquar describes in the Barometer only three different diurnal periouls of rising and falling, I could not help suspecting that there must likewise be a fout th, which kad escaped his notice; and that I should be able to discover a periodical falling also in the state of the mercury, between eleven at night and six in the morning, analogous to that which he had observed between elcren at mid-day and six in the evening. Accordingly, by keeping myself awake, and continuing my observations during the night, I have now the satisfaction to be assured that my anticipation of the revolution I expected to discover, was perfectly just.
IV.

With a view of ascertaining the progre:s of these four different revolutions by personal observation, I
imposed upon myself the task of observing and recording the changes of the Barometer, as far as I was able, every half-hour, day and night, during the period of one complete lunation.

The result of this undertaking I have now the honour to lay before the Society; and if in matter or form it contains any thing worthy of their attention, or of a place amongst their Researches, it will afford me a degree of satisfaction that will more than reward me for my labour.
I. OF THE PERIODICAL DIURNAL CHANGES

OF THE BAROMETER.

$$
\begin{gathered}
\text { THE DETAIL, OF FACTS. } \\
\text { V. }
\end{gathered}
$$

Tine Detail of Facts is comprehended in the following record of observations made on the Barometer, as regularly as I was able to perform it, every halfhour, both day and night, during the lunation which intervened between the 31 st of March and the 2gth of April 1794. To these I have added the state of the Thernometer and Wind, with the appearance of the sky.

## VI.

My observations of the Baroneter were taken with scrupulous exactness; and although the weighty hand of sleep has more than once deprived me of observations chat I was just about to make, and was anxious to record, I have never ventured to assume any probable state of the Mercury as an actual observation.
VII. With

## VII.

With respect to the Thermometer, alchough it was liable to some inaccuracy from my not being able to preserve the apartment in which it was hung, uniformly open or shut, yet, as the variations from this cause were trifing, and never obscured the regular and progressive rise and fall which it observes at different periods of the day, I ronceive that my record is suificiently exact for enabling me to decide, with safety, that the daily fluctuations which appeared in the Barometer, were not connected with the daily vicissitudes of heat and cold.

## VIII.

Aithough the state of the wimd was not measured by any instrument, but estimated only grossly by the effect which it appeared to produce on the trees and other ohjects around, still I conceive that I may also venture to determine on this ground, that the diurnal. fluctuation of the Mercury was not connected with the state of the wind.

In the column appropriated for recording the state of the wind, Number I represents a breeze capable of carrying on a ship two or three miles in the hour; Number 2, a breeze capable of carrying on a ship four or five miles; and Number 3, a breeze capable of carrying on a ship six, seven, or eight miles.

## IX.

Neither are the aftearances of the siay defined with much precision or minuteness; yet, upon the description that I have given, 1 think 1 may pronounce
with sufficient confidence，that they did not direct or regulate the periodical diurnal fluctuation of the Barometer．

By conceiving the wind，which in the month of April is generally from some point in the south，car－ rying constantly along with it，in the different degrees of velocity I have described（VIII．）different pro－ portions of light and heavy clouds，we may obtain a tolerably just idea of the appearance of the sky at Cal－ cutta during that month．

To express these different states，we have employed in the record the terms clear，cloudy，and overcast． When few clouds only appear，or none，which is sel－ dom the case at this season，the sky is said to be clear； when the sun or stars shine through a number of clouds，the sky is said to be cloudy；and when the sun or stars do not appear at all，the sky is said to be overcast．

N．B．As the record of observations from which these negative propositions（VII．VIII．IX．）respecting the thermzometer，the state of the wind，and appearance of the sky are inferred，is volu－ minous，and would necessarily excluce from this volume of the Researches matter that is much more interesting，it has been considered sufficient for the object of this paper，to insert only the opposite abstract，or Synopsis，of the observations made on the Barometer．

THE STATEMENで。

## XI．

THE sum of my observations respecting the four Periodical Diurnal Revolutions of the Baro：zeter which I have described，appears at one view in the preceding
preceding Synoptical Arrangement, and when stated precisely in numbers, amounts to this.

1st, That on every day of the thirty comprehended in the Record, excepting one (a), the Barometer constantly fell between ten at night and six in the morning; and that progressively, and without any intermediate rising, excepting in one instance (b).
$2 d$, That on every day of the thirty comprehended in the Record, without one exception, the Barometer constantly rose between six and ten in the morning; and that progressively, and without any intermediate falling, excepting in two instances $(c)(d)$.
$3 d$, That on every day of the thirty comprehended in the Record, without one exception, the Barometer constantly fell between ten in the morning and six in the evening; and that progressively, and without any intermediate rising in any instance.
4 , The That on every day of the thirty comprehended in the Record, excepting two (e) ( $f$ ), the Barometer constantly rose between six and ten in the evening; and that progressively, and without any intermediate falling in any instance.

## The Inference.

## XII.

From the preceding statement of the coincidences observed in these four portions of the day, it appears that we may reasonably infer the following propositions, limited to Calcutta in the month of April 794.
ist, That, in the interval between ten at night and six in the morning, there existed a prevailing tendency in the Mercury to fall.
2!?, That, in the interval between six and ten in the morning, there existed aprevailing tendency in the Mercury to rise.
3 , That, in the interval between ten in the morning and six in the evening, there existed a prevailing tendency in the Mercury to fall.
4th, That, in the interval between six and ten in the evening, there existed a prevailing tendency in the Mercury to rise.
These different prevailing tendencies to rise and fall periodically at certain times of the day and night, necessarily imply a proportionate corresponding cause sufficient to produce them. . But here we stop, and venture to proceed no farther than to say, with Mr. Farruhar, that they seem to be connected with the diurnal revolutions of the planet which we inhabit.

## XIII.

By an attentive examination of the Synopsis, it will appear that the general characters of the tendencies which prevail at the different periods we have described, are liable, within their respective limits, to several remarkable variations, viz.

1. With regard to the time of beginning to rise or fall.
2. With regard to the time of ceasing to rise or fall.
3. With regard to the steps or degrees by which the Mercury rises or falls.
4. With regard to the limits or extremes to which it rises or falls.
Being under the necessity of acknowledging our ignorance of the cause which produces these prevailing tendencies themselves, we can of course have no adequate idea or conception in, theory of the different circumstances that are capable of producing the different variations which appear in their general character; and our observations being much too limited to establish, concerning them, any thing like practical rules, we must remain contented for the present with pointing them out as questions which want investigation: expressing however a strong suspicion that they are not unconnected with the relative positions of the Moon, and the other planets.

## The Application。

## XIV.

At the time of digesting the ideas which I have delivered upon this subject, being possessed of no information but that which was communicated in Mr. Farquhar's letter, and what 1 obtained afterwards from myown observations, I did not conceive that I was authorized to extend the propositions which I have advanced (XII.) respecting these tendencies, beyond the limits of Calcuttic. By a note, however, which is just now pointed out to me in Dr. Moseley's very ingenious Treatise on Tropical Dis-
eases (a), I have the satisfaction to find that the very same tendencies have been observed to prevail on the opposite side of the globe. We may therefore now venture to allow them a more extensive range; and it will, no doubt, be considered of some importance to establish in certain latitudes (b) the existence of a law in nature by which the Mercury of the Barometer, let the standing weight and pressure of the atmosphere be what it may, is liable to the effects of a constant and regular periodical diurnal fluctuation; for it will then follow that the power of each succeeding hour to raise or sink it, is liable to differ from that which went before; that the height of the Mercury, therefore, taken only at two or three stated hours of the day, cannot with propriety be as-
(a) The Note referred to in Dr. Moseley's Treatise is this:"It has been observed in these and more equatorial regions, that
" though the barometer is useless in indicating the variations of the
"weather, it exhibits a phenomenon not correctly ascertained in
"temperate climates; which is that the Mercu:y has two diurnal
" motions of ascent and descent, of nearly a line corresponding
" with the course of the sun; ascending as the sun approaches the
"zenith and nadir, and descending as the sun deviates from these
"points. It remains stationary at its lowest and highest degrees "for some hours."
(b) As far as I can judge from the following extract from Father COTTE's Memoir on the prevailing winds, \&cc. \&cc. which I have just met with in the Edinburgh Magazine for March :792, there seems to be great reason to believe, that similar fluctuations take place in the Mercury, in the different latitudes of Fruope; and that they are not entirely confined to the regions under the equator.
"The Mercury is generally a little lower about two o'clock in "the afternoon than at any other time of the day; and it is high"est towards eight o'clock at night. I would compare this fact "without pretending to draw any consequences from it, with the "phenomenon of the magnetic needie, the greatest variation of
" which from north towaids west takes place about two or three
"in the afternoon, and the least about eight o'clock in the morn"ing." -Vide the Edinburgh Magazine for Mar sh L792, page 2 II. par. 6.
sumed to represent or form a just estimate of the whole twenty-four; that calculations proceeding hitherto on such partial grounds, must necessaily include error and require adjustment, and that in fut ture, wherever this law extends, no correct philosophical investigation connected with the nature of the atmosphere, can be carried on without giving it a place (c); and no just prognostic formed of the weather without distinguishing those regular and constant changes from such as are only occasional and temporary.

With respect to Medicine, this law is a principle entirely new; and it has now become a matter of real consequence, to ascertain in what respects it cooperates with the power of the sun and moon in producing and regulating the paroxysms of fevers. From the striking coincidence of these tendencies with the periods at which the paroxysms of fevers generally attack and remit, and from their superior prevalence in tropical climates where the paroxysms of fever are also most prevalent, "it seems to be highly probable that they may have a considerable share in constituting that power which shews itself in so remarkable a manner in this country, and which we have denominated Sol-Lunar Influence."
II. Of the Periodical Septenary Changes of the Barometer.

## XV.

Respeciing periodical septenary changes in the state of the Barometer, the only information I have
(c) A mean, extracted from means ohtained from the extremes of these different diurnal fluctuations, will give the mean weight of the atmosplvere ruch more corsectly than the common process.
been able to obtain, is extracted from an abridged Exposition of the System of Mr. Toaldo upon the probability of the change of weather by the lunar points taken from the Jourral des Sciences Utiles, and published in the Calcutta Magazine for July and August i793. Mr. Toaldo, it appears, in order to ascertain whether the moon had any influence on the Mercury, collected a journal of the Barometer kept for several years, from which he discovered that the Barometer was six-tenths of a line higher at the rimes of the quadratures than at the syzygies.

If this journal was kept correctly on a proper plan, periodical septinary changes in the Barometer connected with the revolutions of the moon, are established of course. But if it was kept in the ordinary way of assuming two or three observations taken in the course of the day, to serve as a standard or rule for estimating the state of the whole twenty-four, it is evidently liable to errors which render the calculation precarious and inconclusive for the reasons already explained, which however had not occurred to me at the ime of writing my last Treatise on Sol-Lunar Influence.
THAT the Barometer will be differently affected at the springs and neaps, is an anticipation which has in its favour the strongest probability that analogy can afford. Yet, upon a review of the observations collected during the springs and neaps of the lunation which I have observed, I cannot say that, when arranged as they stand in the Synopsis, in coincidence with their respective periods, they exhibit a difference of character to establish this conclusion. We therefore leave it to the decision of a far more exten-
sive experience, conducting its observations on a plan similar to that which we have exemplified in this Treatise.

In looking over Dr. Moseley's. Treatise on this occasion, I am sorry to discover that trusting too much to memory, in referring to his work in my last publication, 'I have given a very imperfect account of what he has communicated on the subject of SolLunar Influence. But when he considers that by my inaccuracy I have deprived myself of the weight of his authority in supporting a proposition I was anxious to establish, he will be inclined to ascribe it to the cause I have stated. Dr. Moseley's observations are contained in the Conclusion to his Treatise, between page 550 and 556: they confirm the power of Sol-Lunar Influence in Europe in a very unequivocal manner, and merit the attention of thase who wish for information on this subject.---For the note to which this remark refers, vide page 2 I2.

> ON THE DUTIES
> OF A FAITHFUL HINDU WIDOH.

BY HFNRY COLEBROOKE, ESQ.

WHILE the light which the labours of the Asiatic Society have thrown on the sciences and religion of the Hindus, has drawn the attention of the literary world to that subject, the hint thrown out by the President for rejecting the authority of every publication preceding the translation of the

$$
\mathrm{P}_{4}
$$

Gitá,

Gitá, docs not appear to have made sufficient impression. Several late compilations in Europe betray great want of judgment in the selection of authorities; and their motley dress of true and false colours tends to perpetuate error; for this reason it seems necessary on every topic, to revert to original authorities for the purpose of cancelling error or verifying facts already published; and this object will no way be more readily attained than by the communication of detached essays on each topic, as it may present itself to the Orientalist in the progress of his researches.

From this or any other motive for indulgence, should the following authorities from Sanscrit books be thought worthy of a place in the next volume of the Society's Transactions, I shall be rewarded for the pains taken in collecting them.
"Having first bathed, the widow, dressed in two "clean garments, and holding some cúsa grass, sips "s water from the palm of her hand. Bearing cúsa " and tila (a) on her hand, she looks towards the "s east or north while the Brámana utters the mystic " word Om. Bowing to Nerayana, she neät deciares "(b): "On this month, so named in such a Pacsha, "f on such a tit'hi, I (naming herself and her (c) "f family) that II may meet Aruninhati' (d) and re" side in Swarga; that the years of my stay may be
(c) Sesamum:
(b) This ceclaration is calied the Sancalpa.
(c) Gótra, the family or race. Four great families of Brábmanas are now extant, and have branched into many distinct races. Since the memorable massacre of the Cshatriyàs, by Parasu Ràma, the C'sbatriyas describe rhemselves from the same Götras as the Bràd>manap;
(d) Wife of Vasisht ha.

## OF A EATTHEUL HINDU WIDOW.

" numerous as the hairs on the human body; that I " may' enjoy with my husband the felicity of hea" ven, and sanctify my paternal and maternal pro" genitors, and the ancestry of my husband's fa" ther; that lauded by the Apsarases, I may be hap"py with my lord, through the reigns of fourteen "Indras; that expiation be made for my husband's " offences, whether he has killed a Britimiann, " broken the ties of gratitude, or murdered his friend, " thus I ascend my husband's burning pile. I call " on you, ye guardians of the eight regions of the "world! Sun and Moon! Air, Fire, 压ther ( $e$ ?,
"Earth, and Water! My own soul! Yama! Day,
" Night, and Twilight! And thou, Conscience, bear
"، witness: I follow my husband's corpse on the fu-
" neral pile ( $f$ )."
"Having repeated the Sancalpa, she walks thrice " round the pile; and the Brifmana utters the fol" Lowing Mantras:
"On! Let these women, not to be widowed " good wives, adorned with collyrium, holding cla" rified butter, consign themselves to the fire. Im" mortal, not childless, nor husbandless, excellent, " let them pass into fire, whose original clement is "s water.

From the Rigvéda.
(c) Acàs s.
( $f$ ) In several publications the woman has been described as placing herself on the pile before it be lighted; but the ritual quoed is conformable to the text of the Bhojavata.
" When the corpse is about to be consumed in the Sabótaja* , the faithful wife who stood without, rushes on the fire."

Na'reda to Yudisht'hira.

* Cabin of grass or leaves, sometimes erected on the funeral pile.
"The Shed on the funeral pile of a Muni" is called Parn'o'taja and Sahóraja," See the vocabulary ebtitied Hárábali'.
"On! Iet these wivcs, pure, beautiful, commit 6 themselves to the fire, with their husband's corpse. A Pauránica Mantra.
"WITH this benediction, and uttering the mysEt tic Namó Namah, she ascends the flaming pile."

While the prescribed ceremonies are performed by the widow, the son, or other near kinsman, of the deceased, applies the first torch, with the forms directed for funcral rites in the Grilya $\left(g^{\circ}\right)$; by which his tribe is governed.

The Sancalpa is evidently formed on the words of Angiras';
" The wife who commits herself to the flames *s with her husband's corpse, shall equal ARUND© HATI', and reside in Swarga;
"Accompanying her husband, she shall reside so " long in Swarga as are the thirty-five millions of " hairs on the human body.
"As the snake-catcher forcibly drags the serpent " from his earth, so, bearing her husband from " hell, with him she shall enjoy heaveniy bliss. "Dying with her husband, she sanctifies her ma" ternal and paternal ancestors; and the ancestry of " him to whom she gaje her virginity.
$(g)$ Extracts or compilations from the sacred books, containing the particular forms for teligious ceremonies, to be obseryed by the race or family for whom that portion of the sacred writings has been adopted, which composes their Gribya. We learn from the Dbbergavata, that VYa'sa divided the Véda into four (rich, rajush, Eáman, and $A t^{2} b a v i v a n$ ) or five, including the Itibàsas or other Purarat as one Véda. Paila accepted the Riguéde; Jaimeni and Cavi, or Sucra, the Sarmaveiac; Fatsampayana learned the Rajurvéda; Samuntu, Daruna, andothers of the family of $A_{N}$ giras, the At'barvavéda. "My father (Suc'ha, son of Vya'sa "'speaks) selected the Itibrisas and Puranas; then the several Ri'shis "chose the Vrdas variously (parts of each). Their pupils, the "successors of their pupils, and the pupils of these, became fol" lowers of particular séce'ba's."

## OF A FAITHFUE HINDU WIDOW. 219

"Such a wife, adoring her husband, in celestial "felicity with him, greatest, most admired (h), " with him shall enjoy the delights of heaven while " fourteen Indras reign.
"Thougr her husband had killed a Bréhmana, " (i) broken the ties of gratitude, or murdered his " friend, she expiates the crime." Angiras. The Mantras are adopted on the authority of the Brahme Purana.
"While the pile is preparing, tell the faithful " wife of the greatest duty of woman, she is loyal and "pure who burns herself with her husband's corpse. " Hearing this, fortified (in her resolution) and full " of affection, she completes the Pitri'mheda Yaga " $(k)$ and ascends to Swarga."

Brahme Purana.
It is held to be the duty of a widow to burn herself with her husband's corpse ; but she has the alternative,
" On the death of her husband, to live as "Brahmachìr, or commit herself to the flames."

> Vishivi.

The austerity intended consists in chastity, and in acts of piety and mortification.
(b) The word in the text is expounded "lauded by the choirs of heaven, Gandlarvas," \&c.
(i) The commentators are at the pains of shewipg that this expiation must refer to a crime committed in a former existence; for funeral rites are refused to the murderer of a Brabmanna.
(h) Act of burning herself with her husband.
«6 The use of 'Tambilla, dress, and feeding off ves. "sels of tutenague is forbidden to the Yati $(l)$, the *Brahmachiri, and the widow.

> PrACHE'tAS.
"The widow shall never excced one meal a day, * nor sleep on a bed: if she do so, her husband falls * from Sruarga.
"She shall eat no other than simple food, and " (m) shall daily offer the tarpang of chisa, tila, - and water ( $n$ ).
"In. Waisác'ha, Ca'rtica, and Ma'gha she shall ex" ceed the usual duties of ablution, alms, and pilgri" mage, and often use the name of God in prayer." The Smritio.
After undertaking the duty of a Sati, should the widow recede, she incurs the penalties of deflement.
"IF the woman, regretting life, recede from the "s pile, she is defiled; but may be purified by ob-
" serving the fast called Pràjàpatya" ( 0 ).
Apastamba.
Thouga an alternative be allowed, the Hindu legislators have shown themselves disposed to encourage widows to burn themselves with their husband's. corpse.
(I) Sannyasd.
(m) If she has no male descendants. See Nadana Parijatu,
( $n$ ) Oblatious for the manes of ancestors to the third degree, though not exclusively; for the prayer includes a general petition for remoter ancestors. Yet daily oblations (Vaisvédéva) are separately offered for ancestors beyond the third degree.
(o) It extends to twelve days; the first three, a spare meal may be taken once in each day; the next three, once in each night ; the succeeding tnree days, nothing may be eaten but what is given unsolicited; and the latt three days are a rigid fast.

Hárít'a thus defines a loyal wife: "She, whose "sympathy feels the pains and joys of her husband; "who mourns and pines in his absence, and dies " when he dies, is a good and loyal wife.

## Hárita.

"Always revere a loyal wife, as you venerate " the Dévatés; for, by her virtues, the prince's em" pire may extend over the three worlds."

> Matsya Puràna.
" THOUGH the husband died unhappy by the dis" obedience of his wife: if from motives of love, " disgust of the world, fear of living unprotected, " or sorrow, she commit herself to the flames, she " is entitied to veneration."

> Makíd Bhírata.

Obsequies for suiciecs are forbidden; but the Rigvida expressly declares, "that the loyal wife who " burns herself, shall not be deemed a suicide. When " a mourning of three days has been completed, the "Sríddha is to be performed*. This appears from " the prayer for the occasion, directed in the Rig" vèlla."

Regularly the chief mourner for the husband and for the wife, would, in many cases, be distinct persons: but the Bhavishya Purina provides, thent
" When the widow consigns herself to the same " pile with the corpse of the deceased, whoever per" forms the Criya for her husband, shall perform it " for her."

* The shortness of the mourning is honourable: the longest mourning is for the lowest tribe.
"As to the ceremonies from the lighting of the "f funeral pile to the $P$ inda; whoever lights the pile, "shall also offer the Pinda." Va'yu Purinna. Is certain circumstances the widow is disqualified for this act of a Satí.
"She who has an infant child, or is pregnant, or "whose pregnancy is doubtful, or who is unclean, " may not, O princess! ascend the funeral pile.
"So said Na'reda to the mother of Sagara."
"The mother of an infant shall not relinquish the
"care of her child to ascend the pile; nor shall one
" who is unclean (from a periodical cause) or whose
" time for purification after child-birch is not passed,
" nor shall one who is pregnant, commit herself to the
"flames $(q)$. But the mother of an infant may, if
"s the care of the child can be otherwise provided."

> Vrihaspati.

In the cent of a Brinmand dying in a distant rountry, his widow is not permitted to burn herself. "A Viprii or Brìimuma may not ascend a second " pile." Go'tama.
But with other casts, this proof of fidelity is not precluded by the remote decease of the husband, and is called Anugamana.
"The widow, on the news of her husband's dying " in a distant country, should expeditiously burn " hereelf: so shall she obtain perfection." Vya'sa.
(q) It has been erroneously asserted, that a wife, pregnant at the tinie of her husband's death, may burn herself after delivery. Hindu authorities positively contradict it. In addition to the text it may be remarked, that it is a maxim, "What was prevented in " its season, may not afterwards be resumed."
"Should the husband die on a journey, holding " his sandals to her breast, let her pass into the flames."

> Brahme Purina.

The expression is not understood of sanduls exclusively: for thus Usanas or Sucra.
"Except a Viprà, the widow may take any thing "that belonged to her husband, and ascend the pile. "Buta Fiprè may not ascend a second pile; this "practice belongs to other tribes." Sucra.

In two of the excepted cases, a latitude is allowed for a widow desirous of offering this token of loyaltr, by posiponing the obsequies of the deceased: for VYA's a directs that, "If the loyal wife be distant " less than the journey of a day, and desire to die "with her husband, his corpse shall not be burnt "until she arrive. And the Bharishya Purina per" mits that the corpse be kept one night, if the third " day of her uncleanness had expired when her hus" band died."

Wit h respect to a circumstance of time ( $(\underset{r}{ })$, which might on some occasions be objected, the commentators obviate the difficulty, by arguing from several texts, " that to die with or after her husband, is for " a widow N'aimitfica (s) and Cámya ( $t$ ), and conse" quently allowable in the intercalary month;" for Dacsha teaches, that " whenever an act buth "Namittica and Cimy: is in hand, it is then to be "performed without consulting season." They are at the trouble of removing another difficulty:
(r) Occasional observances are omitted on'intercalary days.
(s) Eventual; incumbent when a certain event happens.
(t) Optional; done for its seward.
"Dhritara'shtra, in the state of Samadhí, "* quitted his terrestrial form to proceed to the Muc* "t TI, or beatitude, which awaited him. When the ss leaves and wood were lighted to consume the corpse, ${ }^{6}$ his wife Gandinatrí was seen to pass inio the "flames: Now also, a husband dying at Caisi and ss attaining Muicti, it becomes his widow to follow "s the corpse in the flames."

Ir were superfluous to pursue commentators through all their frivolous distinctions and laborious illustrations on latent difficulties.

All the ceremonies essential to this awful rite are included in the instructions already quoted. But many practices have been introduced, though not sanctioned by any ritual. A widow who declares her resolution of burning herself with the corpse, is required to give a token of her fortitude: and it is acknowledged, that one who receded after the ceremony commenced, would be compelled by her relations to complete the sacrifice. This may explain circumstances described by some who have witnessed the melancholy scene.'

Other ceremonies noticed in the relations of persons who have been present on such occasions, are directed in several rituals:
"Adorned with all jewels, decked with minium "s and other customary ornaments, with the box of " minium in her hand, having made pújí, or adoration " to the Dévétás, thus reflecting that this life is " nought: my lord and master to me was all, - she "s walks round the burning pile: she bestows jewels " on the Brahmanas, comforts her relations, and

$$
\text { OF A FAITHFUL HINDU WIDOW. } 225
$$

6 shows her friends the attentions of civility; while
"calling the Sun and elements to witness, she dis-
"s tributes minium at pleasure; and having repeated " the Sancalpa, proceeds into the flames: there em" bracing the corpse, she abandons herself to the fire, "calling Satya! Satya! Satya!"

The bye-standers throw on butter and wood: for this, they are taught, that they acquire merit exceeding ten million fold, the merit of an Aswamèdha, or other great sacrifice. Even those who join the procession from the house of the deceased to the funeral pile, for every step are rewarded as for an Aswamedtia. Such indulgences are promised by grave authors: they are quoted in this place only as they seem to authorize an inference, that happily the martyrs of this superstition have never been numerous. It is certain that the instances of the widow's sacrifices are now rare: on this it is only necessary to appeal to the recollection of every person residing in India, how few instances have actually occurred within his knowledge. And, had they ever been frequent, superstition would hardly have promised its indulgences to spectators.

## - ON-THETRACES

> OFTHE

## HINDU LANGUAGE and LITERATURE,

Extant amongst the Malay's.

3Y WILLIAM MARSDEN, ESQ.

THE Sinscrit, or ancient language of the Hindus, is a subject so interesting in itself, that every discovery which contributes to throw light upon its history or to mark its extent, carries with it a degree of importance: The proofs of its influence in the northern countries of Assam, Nepal, Booten, and Tibet, as well as in the southern parts of the peninsula of India, are to be found in the works of the Missionaries and the Researches of this Society, but the progress it made in early times, amongst the inhabitants of the eastern islands and countries possessed by the Malays, has not, I believe, been pointed out by any writer. My acquaintance with the language of the latter people, together with some attention paid to the dialcets of India in general, have enabled me to observe, that the Malayan is indebted to the Fanscrit for a considerable number of its terms. I have also satisfied myself, that the intercourse by which this communication was effected, must have taken place in times anterior, probably by many centuries, to
the conversion of these people to the Mahometan religion. The language, it is true, abounds at nresent with Arabic words, which their writers affect to introduce, because this display of literary skill is, at the same time a proof of their religious knowledge; but they are generally legal or metaphysical terms, borrowed from the Koran and its commentaries; are never expressive of simple ideas, have not been incorporated into the language (a few excepted) and are rarely made use of in conversation. The Hindu words, on the contrary, are such as the progress of civilization must soon have rendered necessary, being frequently expressive of the feelings of the mind, or denoting those ordinary modes of thought which result from the social habits of mankind, or from the evils that tend to interrupt them. It is not however to be understood, that the affinity between these languages is radical, or that the names for the common objects of sense are borrowed from the Sanscrit. The Malayan is a branch or dialect of the widely extended language prevailing throughout the islands of the Archipelago, to which it gives name (*), and those of the South Sea; comprehending between Madagascar on the one side, and Easter Island in the other, both inclusive, the space of full two hun-dred-degrees of longitude. This consideration alone is sufficient to give it claim to the highest degree of antiquity, and to originality, as far as that term can be applied. The various dialects. of this

- The Malay-Archipclago may be understood to comprehend the Sunda, Pbilippine, and Molucca islands, in the maritime parts of which, the Malayan is used as a lingua france.
speech, though they have a wonderful accordance in many essential properties, have experienced those changes which separation, time, and accident produce, and in respect to the purposes of intercourse, may be classed into several languages, differing considerably from each other. The marks of cultivation by which the Malayan is distinguished from his ruder neighbours, are to be attributed, in my opinion, to the effects of an early connexion that must have subsisted between the inhabitants of this eastern peninsula and those of the continent of India; but what the nature and circumstances of this connexion may have been, it is not easy to détermine. A spirit of foreign conquest, and still more, a zeal for the propagation of their religious tenèts, appear incompatible with the genius of the Hindzu system, excepting amongst the disciple"s of BHOOD ; but I have nerer discorered in the Mulayan customs or opinions any traces of the peculiar institutions of that extraordinary sect.

A commercial intercourse has always subsisted between the manufacturing countries of India and the marts for the produce of the Spice-islunds, such as Johor, Singapoora, and Malacca; and when the Portugiuse, at the commencement of the sixteenth century, first visited these places, they mention with surprize the concourse of foreign vessels assembled there. But independently of other objection's that might be raised to the probability of these traders having polished the language of the people whose ports they frequented, or having imparted to them their rational literature, it is to be observed
that by much the greater proportion of the ships belonging to native merchants, which now enter the straits of Mallucca, come from the coast of Coromandel, and consequently are navigated by persons who speak the languages prevailing in that part; whereas it is evident, that, from the Telinga, or the Tumool, the Maldyan has not received any portion of iss improvement, but from the genuine Hinduvce of the northern provinces, prior to its debasement by the mixture of Aralic nouns, and the abuse of verbal auxiliaries. If the communication must necessarily be supposed to have its origin in commerce, 1 should be inclined to consider the people of Guzerat, notwithstanding their distance, as the instructors of the Malays. Their resort to Malacca is particularly noticed by De Barros, and other authentic writers; and it is well known that the Hindu language has been preserved with more purity in that, than in any othe: maritime province of India.
' $\Gamma_{\text {He nature of the affinity suggested, will suffici- }}$ ently appear to those who are conversant with the Hindu dialects, by the following examples of Sanscrit words, which are at the same time so familiar to the Malays, and so thoroughly incorporated into their vernacular tongue, that their foreign origin is never suspected, although the terms adopted from the drabs can, with very few exceptions, be immediately pointed out by the most ordinary scholar. It is true that he is assisted in this discrimination by the peculiarities of the Arabic orthography; for the Maluys, as well as the Persiuns and other peopic, who, in consequence of their conversion to the faith of the Koren, employ
this alphabet in their writings, do yet reject the use of certain letters, either as superfluous, or as not suited to the smoothness of their own sounds, and which therefore appear only in words purely Arabic. The Hinduvee words, on the contrary, being divested of their proper dress, and clothed, in common with those originally Malayan, in the adopted Arabic character (with certain judicious modifications) want the same token of their origin, and are more assimilated with the rest of the language.

Is this short list of words taken, with little pains in the selection, from a Malayan dictionary, the departure from the Hinduvee is scarcely more than may arise from a different habit of spelling them in our letiers, unless where it consists in a slight variation of the sense, or of the part of speech.

| Bechara. Advice, counsel, | Yaga. To watch. |
| :---: | :---: |
| judicial proceeding. | Pootree. Princess. |
| Becjee. Seed. | Rata. Chariot. |
| Boodes. Wisdom, under- | Pernama. Full moon. |
| standing. | Charee. To seek. |

An inspection of the characters uised by the natives cf the :slands, who have not adopted the Malayan or Arabic mode of writing, will shew that in the arrangement of their letters they have taken the Hindu for their guide, and have even preserved the rhythmus terminated by a nasal; which so peculiarly distinguishes this from every other system. The aspirated letters not being required for expressing the sounds of these languages, are omitted, and each division of the series consists therefore of three, instead of five. In

HINDU LANGUAGE AND LITERATURE. 2SI the Rejang alphabet the order is as follows: $K a, g^{a}$, $n g a ; T a, d a, n a ; P a, b a, m a ;$ Cha, ja, nia, \&c. (see History of Sumatra, plate.) In the Sanscrit, I need scarcely to observe, the series of consonants begins thus, Ka, k'ha, ga, g'ha, nga; Cha, cli'ha, ja, $\left.j^{\prime} h a, g n y a ; ~ T a, t^{\prime} k a, d a, d\right\rangle h a, n a, \& c$. If other proofs were wanting of the influence of Hindu intercourse in these parts, such conformity alone, in a matter so arbitrary, and which exists equally in other obscure dialects, and extends even to the island of Celebes, would be sufficient to establish it. The languages of these islanders have not, however, been enriched by an accession of Hindu words in any degree proportioned to the Mulayan, which uses the Arabio alphabet ; but the probability is strong, that the inhabitants of the Malay peninsula were in possession of an alphabet on the same model, and were even skilled in composition, before the Makometans introduced their learning and character among them.

But the circumstance which has more immediately struck my attention, and given occasion to these remarks, is that of my having met with frequent allusion in their writings, to the most celebrated works of the Hindu mythological poets, especially the Mahabharat and the Ramayan. A manuscript now lying before me, which is a species of romance, exhibits in almost every page the marks of the author's acquaintance with Hindu literature and manners. It contains the adventures of two princes, who were sent by the king their father, to obtain for him the possession of an-extraordinary self-performing in-

Q4 strument
strument of music, whose enchanting air he had heard in a dream. Fowever flimsy this foundation, and incoherent the parts of its superstructure, it gives scope to the display of a lively and fertile imagination, much delicate imagery, and pathetic expression of sentiment. The following passages allude, unequivocally, to well-known personages in the Poon rans: - Terlaloo baeck segala roopa'nia maka-indath separtee pandooa leema; "surpassing good was their " whole appearance; most admirable, like unto the "- five Pandoos." Again: Lakoo'nia meng-amok eetoo separtee pandooa leema tatkala cea meng-amiok dedalam rayet kooraoo; " the manner in which they " fought was like that of the five Pandoos when they" rushed into the ranks of the Kooroos." These can be no other than the renowned favourites of Krishnis whose brilliant actions and personal accomplishments are the theme of immortal song. The machinery of the Raniayan is interwoven with the story; and this circumstance tends to increase my regret that we possess no translation, even in abstract, of that, much-admired poem. The Malayan princes are, like Rama, attended in their wars by apes of extraordinary endowments, who fight with more than human prowess, and overcome the Raksasa, or hobgoblins, who serve under the banners of the: adversary. One of the former, whose talents as an ambassador are the subjest of panegyric, is said to resemble that diplomatic monkey who was sent by Sree Rama to the King of Langkupooree. The, mixture of qualities and actions gravely attributed. to them in their double capacity of monkies and
heroes, produces a very ludicrous and amusing effect. Though their ideas are rational, their manners and propensitics are faithful to nature. Mention is also made of Bisno dewa; of the mountain Maba-meroo; of the blue lotos growing in the pool Mandoo ratne; of a lion possessing supernaturai powers, Sing-asaktce, and elsewhere Sing-a-rajoon, who shot arrows at Molaraja Karna. Some of these latter names I do not recollect to have met with in the notices we have of the Hindu mythology.

These similies and allusions must refer, as in all poctry, to stories with which the readers were presumed to be well acquainted, and secm to imply, that translations of the works were formerly in the hands of the Malays. I do not know that such remain amongst them at this day: but my ignorance is no proof of the contrary; for at the time when I had opportunities of making the enquiry, I was uninformed as to the existence of the originals, and the passages above quoted were of course unintelligible to me. They must be sought for in the peninsula of Malacca, or amongst the Menangkabon people in Sumatra. A spirit of investigation is now gone forth, and under the influence of the Asiatic Society, and from the example of its President, we may confidently hope that ino region of oriental literature will be left unexplored.

Since the foregoing Paper was written, and communicated to a few friends, I have seen a copy of the third volume of the Asiatic Researcles (just seceived from Calcutta) and obscree that the connexion
nexion between the Malayan and the Sanscrit has not escaped the notice of the President, whose learned and elegant Anniversary Dsicourse points it out ( P. I I \& I 12 ) in a clear and decided manner. The sanction of his authority to my opinion fully reconciles me to the anticipation of a supposed discovery.

## BOTANICAL OBSERVATIONS

on
SELECTINDIANPLANTS．＊

BY THE LATE PRESIDENT．
－F my names of plants displease you，says the great Swedish botanist，choose others more
＇agreeable to your taste；＇and，by this candour，he has disarmed all the criticism，to which，as it must be
＊This paper was announced in the specimen of an Asiatic Common－place Book，which the President added，in the third volume of these Transactions，to Mr．Harrington＇s proposal for an im－ provement of Locke＇s useful plan．
allowed, even the critical parts of his admirable works lie continually open. I avail myself of his indulgence, and am very solicitous to give Indian plants their true Indian appellations; because I am fully persuaded that Linnzus himself would have adopted them, had he known the learned and ancient language of this country; as he, like all other men, would have retained the native names of Asiatic regions and cities, rivers and mountains; leaving friends, or persons of eminence, to preserve their own names by their own merit, and inventing new ones, from distinguishing marks and properties for such objects only as, being recently discovered, could have had no previous, denomination. Far an I from doubting the great importance of perfect botianical descriptions; for languages expire as nations decay, and the true sense of many appellatives, in every dead language, must be lost in a course of ages : but, as long as those appellatives remain understood, a taavelling physiciari, who should wish to procure an Arabian or Indian plant, and, without asking for it by its learned or vulgar name, should hunt for it in the woods by its botanical character, would resemble a geographer, who, desiring to find his way in a foreign city or province, should never enquire, by name, for a street or a town, but wait with his tables and instruments, for a proper occasion to determine its longitude and latitude.

The plants described in the following paper by their classical appellations, with their synonyma, or epithets, and their names in the vulgar dialects,
have been selected for their notelty, beauty, poetical fame, repited use in medicine, or supposed holiness; and frequent ailusions to them all will be found, if the Sanscrit lenguge should ever be generally studied, in the popular and sacred pooms of the ancient Hinduis, in their medical books and lawtracts, and even in the Fedas themselves. Though, unhappily I cannot profess, with the fortunate Sweede, to have seen without glasses all the parts of the flowers which I have described, yet you may be assured that I have mentioned no part of them whicin I have not again and again examified with my own eyes; and though the weakness of mig sight will for ever prevent my becoming a botanist, yet I have in some little degree atoned for that fatal defect by extreme attention, and by an ardent zeal for the most lovely and fascinating branch of natural knowledge.

Before I was acquainted with the method pursued by Van Rueete, necessity had obliged me to follow a similar plan on a smaller scale ; and, as his mode of studying botany, in a country and climate by no means fayourable to botanical excursions, may be adopted more suiccessfully by those who have more leisúre than [ shall ever enjoy, I present you with an interesting passage from one of his prefaces, to which I should barely have referred you, if his great woik were not unfortunately confined, from its rarity, to very few hands. He informs us, in an introduction to his third volume," that several " Indian physicians and Brähmens had composed by
ct his order, a catalogue of the most celebrated plants " which they distributed according to their times of " blossoming and seeding, to the configuration of " their leaves, and to the forms of their flowers and " fruit; that, at the proper seasons he gave copies " of the list to several intelligent men, of whom he "sent parties into different forests, with instructions " to bring him, from all quarters, such plants as " they saw named, with their fruit, flowers, and " leaves, even though they should be obliged to "climb the most lofty trees for them ; that three or " four painters, who lived in his family, constantly " and accurately delineated the fresh piants, of " which, in his presence, a full description was " added; that, in the mean while, he had earnestly " requestd all the princes and chiefs on the Malabar " coast to send him such vegetables as were most " distinguished for use or for elegance; and that " not one of them failed to supply his garden with " flowers, which he sometimes received from the dis" tance of fifty nr sixty leagues; that when his herb" arists had collected a sufficient number of plants, " when his draughtsmen had sketched their figures, " and his mative botanists hard subjoined their descrip. " tion, he submitted the drawings to a little aca" demy of Pandits, whom he used to convene for " that purpose from different parts of the country; " that his assembly often consisted of fifteen or six. " teen learned natives, who vied with each other in " giving correct answers to all his questions concern"6 ing the names and virtues of the principal vegetaVol. IV.

R
bles;
"s bles; and that he wrote all their answers in his " note-book; that he was infinitely delighted with " the candid, modest, amicable, and respectful de-
" bates of those pagan philosophers, each of whom.
" adduced passages from ancient books in support.
" of his own opinion, but without any bitterness of " contest or the least perturbation of mind ; that the " texts which they cited, were in verse, and taken "s from books, as they positively asserted, more than. " four thousand years old: that the first couplet of. " each section in those books comprised the synony" mous terms for the plant, which was the subject " of it $;$ and that, in the subsequent verses, there " was an ample account of its kind or species, its " properties, accidents, qualities, figure, parts; " place of growth, time of flowering and bearing " fruit, medical virtues, and more general uses; " that they quoted those texts by memory, having " gotten them by heart in their earliest youth, ra-. "ther as a play than a study, according to the im${ }^{\prime 6}$ memorial usage of such Indiun tribes as are des${ }^{6} 6$ tined by law to the learned professions; and on "that singular law of tribes, peculiar to the old "Egyptians and Indians; he adds many solid and "pertinent remarks." Now when we complain, and myself as, much as any, that we have no leisure in India for literary and philosophical pursuits, we should consider that Van Rheede was a nobleman, at the head of an Indian government, in his time very considerable, and that he fully discinarged all the duties of his important station, while he found
leisure to compile, in the manner just described, those twelve large volumes which Linnews himself pronounces accurate.

1. Ta'raca:

Vulg. Tárac.
Linn. Amomum.
Cal. Perianth spathe-like, but sitting on the germ; tubular, one-leaved, broken at the mouth into few irregular sharp toothlets; downy, straited; in part coloured, in part semi-pellucid.
Cor. One-petaled, villous. Tube short, funnelform. Border double. Exterior three parted; coloured like the calyx ; divisions oblong, striated, internally concave, rounded into slipper-like bags; the two lower divisions equal, rather deflected; the higher somewhat longer, opposite, bent in a contrary direction, terminated with a long point, Interior, two-lipped (unless the upper-lip be called the filament); under-lip revolute, with a tooth on each side near the base ; two-parted from the middle; divisions axe-form, irregularly end-nicked. Nectcries, two or three honey-bearing, light brown, glossy bodies at the base of the under lip, just below the teeth; erect, awled, converging into a small cone.
Stam. Filament (unless it be called the upper lip, of the interior loorder) channclled within, sheathing the style; dilated above into the large fleshy anther, if it can justly be so named. Anther oblong externally convex and entire, internally flat, divided by a deep furrow; each division marked R 2
with
with a perpendicular pollen-bearing line, and ende: ing in a membranous point.
Pist. Germ beneath, protuberant, roundish, obscurely three sided, externally soft with down. Style, thread-form, long as the filament, the top of which nearly closes round it. Stigma headed, perforated.
Per. Capsule (or Capsular berry, not bursting in a determinate mode) oblong-roundish, three-striped, smooth, crowned with permanent calyx and corol; with a brittle coat, almost black without, pearly within.
Seeds lopped, with three or four angles; very smooth, enclosed within three oblong, rounded, soft, membranous integuments, conjoined by a branchy receptacle; in each parcel, four or five.
Interior Border of the corol, pink and white; under lip internally milk-white, with a rich carminestripe in each of its divisions. Seeds aromatic, hotter than Cardamoms. Jeeaves alternate, sheathing, oblong, pointed, keeled, most entire, margined, bright grass-green above, very smooth; pale sea-green below. Stem compressed, three or four feet long, bright pink near its base, erect, ending in a beautiful panicle. 'Pecluncles many flowered; bracts few, lance-linear, very long, withering. Root fibrous, with two or three bulbous knobs, light brown and spungy within, faintly aromatic.
Although the Taraca has properties of an Amomum, and appears to be one of those plants which Rumphies names Globba, yet it has the air of a tanguas,

Languas, the fruit, I believe, of a Renealmia, and no exact correspondence with any of the genera so elaborately described by Koenig: its essential character, according to Retz, would consit in its two-parted interior border, its channelled filament, and its two-cleft anther with pointed divisions.
2. Bhu'champaca:

Vulg. Bhúchumpac.
Linn, Round-rooted Kempferia.
Cal. Common Spathe imbricated, many flowered; partial, Perianth one-leaved, small, thin, obscure.
Cor. One petaled. Tube very long, slender, subcylindric below, funnel - form above, somewhat incurved. Border double, each three parted ; eñterior, divisions lanced, acute, dropping; interior, two higher divisions erect, lapping over, oblong, pointed, supporting the back of the anther; lower division expanding, deflected, two cleft; subdivisions broad, axe-form, irregularly notched, endnicked, with a point.
Stam. Filament adhering to the throat of the corol, oblong below, enlarged, and two-lobed above, coloured. Anther double; linear, higher than the mouth of the tube, fixed on the lower part of the filament, conjoined round the pistil, fronting the two-cleft division of the border.
$\mathrm{P}_{\text {ISt }}$. Germ very low near the root, attended with a nectareous gland, Style capillary, very long. Stigna funnel-form below, compressed above; fan-shaped, two-lipped, downy, emerging a little from the conjoined anther.
pra.

Per. and Seeds not yet seen.
Scape thickish, very short. Corol richly fragrant; tube and exterior border milk-white, divisions dropping, as if sensitive, on the slightest touch, and soon yielding to the pressure of the air ; interior border purple, the higher divisions diluted, the lower deeply coloured within, variegated near the base. One or two flowers blow every morning in April or May, and wither entirely before sun-set : after the spike is exhausted, rise the large leaves keeled, broad-lanced, membranous nerved. Root with many roundish, or rather spindle-shaped bulbs.
This plant is clearly the Bencha'po of Rheede, whose native assistant had written Bhu on the drawing, and intended to follow it with Champa': the spicy odour and elegance of the flowers, induced me to place this Kempferia (though generally known) in a series of select Indian plants; but the name Ground Champac is very improper, since the true Champaca belongs to a different order and class; nor is there any resemblance between the two flowers, except that both have a rich aromatic scent.

Among all the natural orders, there is none in which the genera seem less precisely ascertained by clear essenticil characters, than in that which (for want of a better denomination) has been called scitamineous; and the judicious Retz, after confessing himself rather dissatisfied with his own generic arrangement, which he takes from the border of the corol, from the stamen, and principally from the $a n-$ fher, declares his fixed opinion, that the genera in
zhis order will never be determined with absolute certainty zutil all the scitamineous plants of India shall be perfectly described.
3 Sép'halica':
Syn. Suvaha', Nirgudi', Nülica', Nivárica'.
Vulg. Singaha', Nibari.
Linn. Sorrowful Nyctanthes.
In all the plants of this species examined by me, the calyx was villous; the border of the corol white five-parted, each division unequally subdivided ; and the tube of a dark orange-colour; the stamens and pistil entirely within the tube: the berries twin, compressed, capsular, two-celled, margined, inversebearted, with a point. This gay tree (for nothing sorroweful appears in its' nature) spreads its rich odour to a considerable distance every evening ; but at sunrise it sheds most of its night-flowers, which are collected with care for the use of perfumers and dyers. My Pandits unanimously assure me, that the plans before us is their $S e^{\prime} p^{\prime} h a^{\prime} l i c a^{\prime}$, thus named because bees are supposed to sleep on its blossoms; but Nílica must imply a blue colour; and our travellers insist that the Indians give the names of Pa'rijatica or Pa'rijata to this useful species of Ayctanthes. On the other hand, I know that Pairijata is a name given to fowers of a genus totally different; and there may be a variety of this wich blueish corols ; for it is expressly declared, in the Amarcísit, that, when the Sép'ha'"s lica' has ruhite flowers, it is named Ssuétosurasa', and
"Bhu'tave'si.
4. a. Maghya,

Syn. Cunda.
Linn. Nyctanthes Sambac.
See Rheede: 6 H. M. tab. 54.
Flowers exquisitely white, but with little or no fragrance; stem, petioles, and calx very downy; leaves egged, acute ; below rather hearted.
$\beta$ Septala:
Syn. Navamallica', Navama'licá.
Vulg. Béla, Muta-béla.
Burm. Many-flowered Nyctanthes.
See 5 Rumph. tab. 30.6 H. M. tab. 50.
Thf, blossoms of this variety are extremely fragsant. Zambak (so the word should be written) is a flower to which Persian and Arabian poets frequently allude.
5. Mallica:

Syn. Trinasuilya, Malli, Bhu'padi, Satabhiru. Vulg. Dési'-béla'.
Iinn. Wavy-leaved Nyctanthes.
Berry globular, simple, one-celled. SEed large, single, globular.
According to Rheede, the Bra'hmens in the west of India distinguish this flower by the word Cas tu'ri, or mus $\vec{k}$, on account of its very rich odour.
6. 'Asp ${ }^{2}$ нотA':

Syn. Vanamalli.
Vulg. Banmallica.
Linn. Narrow-leaved Nyctanthes.
The Indians consider this as a varicty of the former species; and the flowers are nearly alike. Obtuse leaved would have been a better specific name; the
the petals, indeed, are comparatively narrow, but not the leaves. This charming flower grows wild in the forests, whence it was called Vanajúti by the Bríhmens, who assisted Rheede; but the Játi, or Málati, belongs, I believe, to the next genus.
7. Ma'Latí:

Syn. Sumana', Ja'ti.
Vulg. Máliti, Játi, Chambe'ti.
Linn. Great-flowered Jasmin.
Buds blushing ; corol, mostly with purplish edges. Leaves feathered with an odd one, two or three of the terminal leaflets generally confluent.
Though Ma'lati and Ja'ti' be synonimous, yet some of the native gardeners distinguish them; and it is the $J a^{\prime} t i$ only that I have examined. Сомmeline had been informed that the Javans give the name of Maleti to the Zambak, which in Sanscrit is called Navamallica, and which, according to R heede, is used by the Hindus in their sacrifices; but they make offerings of most odoriferous flowers, and particularly of the various Jasmins and Zambaks.
8. Yut'hica'.

Syn. Ma'gadhí, Ganica', Ambasht"ha', Yút'hio.
Vulg. Juithi, Juï.
Linn. Azorick Jasmin.
Leaves opposite, three'd. Branchlets cross-armed. Umbels three-flowered. Corols white, very fragrant. The' yellow Yúlhici, say the Hindus, is called $H e^{\prime}$ mapushpici, or golden-flowered; but I have never seen it ; and it may be of a different species.
9. Amlica':
9. Amlica':
$\mathrm{S}_{\mathrm{r}} \times \mathrm{N}$. Tintidí, Chincha'.
Vulg. Tintirí; Tamru'lhindí, or Indian Date.
Linn. Tamarindus.
The flowers of the Tamarind are so exquisitely beautiful, the fruit so salubrious when an acid sherbet is required, the lcares so elegantly formed and arranged, and the whole tree so magnificent, that I could not refrain from giving a place in this series to a plant already well known. In all the flowers, however, that I have examined, the coalition of the stamens appeared so invariably, that the Tamarind should be removed, I think, to the sixteenth class; and it were to be wished that so barbarous a word as Tamarindus, corrupted from an Arabic phrase absurd in itself, since the plant has no sort of resemblance to a date-tree, could, without inconvenience, be rejected, and its Indian appellation admitted in its room.
10. Sara: or Arrove-cane.

Syn. Gundra, or playful ; Téjanaca, or Acute. Vulg. Ser, Serheri.
Linn. Spontaneous Saccharum.
Cal. Glume two-valved; valves oblong-lanced, pointed, sub-equal, girt with silky diverging hairs, exquisitely soft and delicate, more than twice as long as the flower.
Cor. One valved, acute, fringed.
Sram. Filanents three, capillary; Anthers oblong, incumbent.
Pist. Gems very minute; styles two, thread-form. Stigmas feathery.

Flowers on a very large terminal panicle, more than two feet long, in the plant before me, and one foot across in the broadest part ; consisting of numerous compound spikes, clivided into spikelets, each on a capillary jointed rachis, at the joints of which are the flowerets alternately sessile and pedicelled. Commonz peduncle many-furrowed, with reddish joints. Valvelet of the corol purple, or light red; stamens and pistils ruddy; stigmas purple; pedicels of a reddish tint, finely contrasted with the long silvery beard of the calyx. Leaves very long, striated, minutely sawed; teeth upwards; keel smooth, white within, sheathing the culm; the mouths of the sheaths thick, set with white hairs. Culm above twenty feet high; very smooth, round, and light; more closely jointed and woody near the root, which is thick and fibrous: it grows in large clumps, like the Venz. This beautiful and superb grass is highly celebrated in the Puranas, the Indian God of War having been born in a grove of it, which burst into a flame; and the gods gave notice of his birth to the nymph of the Pleiads, who descended and suckled the child, thence named Ca'rtice'ja. The Ca'sá, vulgarly Casia, has a shorter culm, leaves much narrower, longer, and thicker hairs, but a smaller panicle, less compounded, without the purplish tints of the Sara. It is often described, with praise, by the Hindu poets for the whiteness of its blossoms, which give a large plain, at some distance, the appearance of a broad river. Both plants are extremely useful to the Inclians, who harden the internodal parts of the culms,
culms, and cut them into implements for writing on their polished paper. From the munija, or culm, of the Sura was made the mamiji, or holy thread, ordained by Menu to form the sacerdotal girdle, in preference even to the Cusa.grass.
ii. Du'rvá:

Syn. 'Sataparvica', Sahasravinyà, Bhárgavi, Rudri', Ananta'.
Vulg. Dúb.
Koen. Agrostis Linearis.
Nothing essential can be added to the mere botanical description of this most beautiful grass, which Van Rheede has exhibited in a coarse delineation of its leaves only, under the barbarous appellation of Beli-caraga. Its fiowers, in their perfect state, are among the loveliest objects in the vegetable world, and appear, through a lens, like minute rubies and emeralds in constant motion from the least breath of air. It is the sweetest and most nutritious pasture for cattle; and its usefulness, added to its beauty, induced the Hindus, in their earliest ages, to believe that it was the mansion of a benevolent nymph. Even the Védla celebrates it; as in the following text of the A'harrana: "May Durvè, which rose from the water of " life, which has a hundred roots and a hundred "stems, efface a hundred of my sins, and prolong " my existence on earth for a hundred years !" The plate was engraved from a drawing in Dr. Roxburg h's valuable collection of Indian grasses.
12. Cus'A, or Cus'ra.

Syn. Cut'ha, Darbha, Pavitra.
Vulg. Cusha.
Koen. Poa Cynosuroides.
Having never seen this most celebrated grass in a state of perfect inflorescence, I class it according to the information which Dr. Roxbergit has been so kind as to send me. The leaves are very long, with margins acutely sawed downwards, but smooth on other parts, even on the keels, and with long points, of which the extreme acuteness was proverbial among the old Hincius. Every law-book, and almost every poem in Sanscrit, contains frequent allusions to the holiness of this plant ; and, in the fourth $V e ́ d a$ we have the following address to it at the close of a terrible incancation: "Thee, O Darbla, the learned proclaim " a divinity not subject to age or death; thee they " call the armour of INDRA, the preserier of regions, " the destroyer of enemies; a gem that gives increase " to the field. At the time when the ocean resound"ed, when the clouds murmured, and lightnings " flashed, then was Durbha produced, pure as a drop " of fine gold." Some of the lcaves taper to a most acute, evanescent point; whence the Pandi/s often say of a very sharp-minded man, that his intellects are acute as the point of a Cusa-leaf.
13. Bandiúca:

Syn. Ractaca, Bandhujizacia.
Vulg. Ba'ndhúti, Ranjan.
Linn: Scarlet Ixora.
Cal. Perianth four-parted, permanent: Wivisions coloured, erect, acute.

254 BOTANICAL OBSERVATIONS
Cor. One-petaled, funnel-form. Tube cylindyic, very long, slender, somewhat curved. Border fourparted; divisions egged, acute, deflected.
Stam. Filaments four, above the throat very short, incurved. Authers oblong, depressed.
Pist. Germ roundish, oblate beneath. Style threadform, long as the tube. Stigma two-cleft, just above the throat; divisions externally curved.
Per.
Seeds.
Flowers bright crimson-scarlet, umbel-fascicled. Leaves oval, cross-paired, half-stem-clasping; pointed, pale below, dark green above, leathery. clothing the whole plant. Stipules between the opposite leaves erect, linear. Steri russet, channellec:
Ture Bandica flower is often mentioned by the best Indian poets; but the Pandits are strangely divided in opinion concerning the plant which the antients knew by that name. Ra'dia'cáne brought me, as the famed Bandhuica, some flowers of the Doubtfut Papaver; and his younger brother Ramácánt produced on the following day the Scarlet Ixora, with a beautiful couplet, in which it is named Bandhíca: Sōon after, Servóru showed me a books in which it is said to have the vulgar name Dóp'lariya, or Meridian; but by that Hindustaini name the Muselmians in some districts mean the Scurlet P entapetes, and, in others, the Scarlet Hibiscus, which the IImdus call Suryamani, or .Gem of the Sun. The lastmentioned plant is the Sicswim of Rheede, which

Linneus, through mere inadvertence, has confounded with the Scarlet Pentapetes, described in the fifty-sixth plate of the same volume. I cannot refrain from adding, that no Indian god was ever named. IXORA; and that Is'wara, which is indeed a title of Siva, would be a very improper appellation of a plant which has already a classical name.
14. Carnicára:

Syn. Dratmótpala, Perioyaidha. Vulg. Cíncra'; Cat'lachumpa'. Linn. Indian Paretta.

Ir is wonderful that the Pandits of this province, both priests and physicians, are unable to bring me the flower which $C_{A}^{\prime} L I D A$ 'sa mentions by the name of Curnicara, and celebrates as a fame of the woods. The lovely Pavetta, which botanists have sufficiently described, is called by the Bengal peasants Cánerit, which I should conclude to be a corruption of the Sanscrit word, if a comment on the Amaracosp had not exhibited the vulgar name Cat'hci-champá; which raises a doubt, and almost inclines me to believe that the Carnicura is one of the many flowers which the natives of this country improperly called wild Champacs.
15. Ma'shandari';

Vulg. Masandarí in Bengal, and Bastra in Mindustín. Linn. American Callicarfus; yet a native of Java?
Cai., Perianth one-leaved, four-parted; Divisions. pointed, erect.

Cor. One-petaled, funnel-form; border four-cleft.
Stam. Filaments four, thread-form, coloured, longer than the corol. Anthers roundish, incumbent.
Pist. Germ above, egged. Slyle thread-form, coloured, longer than the stamens. Stigma thickish, gaping.
Per.
Seeds.
Flowers minute, bright lilac, or light purple, extremely beautiful. Panicles axillary, one to each leaf, two-forked, very short in comparison of the leaves, downy. Bracts awled, opposite, placed at each fork of the panicle. Leaves opposite, petioled, very long, egged, veined, pointed, obtusely notched, bright green and soft above, pale and downy beneath. Branches and petiols hoary with down. Shrub, with fexible branches; growing wild near Calcutta; its root has medicinal virtues, and cures, they say, a cutaneous disorder called másha, whence the plant has its name. Though the leaves be not sawed, yet I dare not pronounce the species to be new. See a note on the Hoary Calificarpus, 5 Retz. Fuscic. p. 1. no 19. 16. Sringa'ata.

Syn. S'ríngítaca.
V ulg. Singhára.
Linn. Floating Trapa.
I can add nothing to what has been written on this remarkable water-plant; but as the ancient Hindus were so fond of its nut (from the horns of which they gave a name to the plant itself), that they placed it among their lunar constellations, it
may certainly claim a place in a series of Indian vegetables.
17. Chandana.

Syn. Gandhasìra, Malayaja, Bhadras'ri'.
Vulg. Chandan, Sandal, Sanders.
Linn. True Santulum; more properly Sandahum.
Seed large, globular, smooth.
Having received from Colonel Fullarton many seeds of this exquisite plant, which he had found in the thickets of Midnapzir, I hid a sanguine hope of being able to describe its flowers, of which Rumphius could procure no account, and concerning which there is a singular difference between Linnews and Burman the younger, though they both cite the same sauthors, and each refers to the works of the other; but the seeds have never germinated in my garden, and the Chundan only claims a place in the present series, from the deserved celebrity of its fragrant wood, and the perpetual mention of it in the most ancient books of the Hindus, who constantly describe the best sort of it as flourishing on the mountains of Malaya. An elegant Sanscrit stanza, of which the following Version is literally exact, alludes to the popular belief, that the Vénus, or Bambus, as they are vulgarly called, often take fire by the violence of their collision; and is addressed, under the allegory of a sandal-tree, to a virtuous man dwelling in a town inhabited by contending factions: " Delight of the world, beloved Chanda" NA, stay no longer in this forest, which is over" spread with rigid pernicious Vans'as, whose hearts Vol. IV.

S
"s are
"6 are unsound; and who, being themselves con" founded in the scorching stream of flames kindled " by their mutual attrition, will consume not their " own families merely, but this whole wood." The original word Durvans'a has a double sense, meaning both a dangerous bambu, and a man with a mischievous offspring. Three other species, or varieties of Chandan, are mentioned in the Amaraco'sha, by the names Tailaparnica, Go'sirsha, and Herichandana: the red sandal (of which I can give no description) is named Cuckandana from its inferior quality, Ranjana and Racta from its colour, and Tilaparni, or Patranga, from the form of its leaves.

- 8. Cumuda:

Syn. Cairava.
Vulg. Ghain-chì.
Rheede: Tsjeroea Cit Ambel. II H. M.t. 29.
Linn. Menianthes?
Cal. Five-parted, longer than the tube of the corol, expanding, permanent; divisions awled.
Cor. One-petaled. Tube, rather belled; border fire-parted; divisions oblong, wavy on the margin: a longitudinal wing or foldlet in the middle of each. The mouth and whole interior part of the corol shaggy.
Stam. Filaments five, awled, erect; Anthers twin, converging; five, alternate, shorter, steril.
Pist. Germ egged, very large in proportion; girt at its base with five roundish glands. Sityle very short, if any. Stigma headed.
Per. Capsule four-celled, many-seeded.

SEEDS round, compressed, minute, appearing rough, with small dots or points.
Leaves hearted, subtargeted, bright green on one side, dark russet on the other. Flowers umbel fascicled, piaced on the stem, just below the leaf; Glands and Tube of the corol yellow; border white ; both of the most exquisite texture : Cumuda, or Delight of the Water, seems a general name for beautiful aquatic flowers; and among them, according to Van Rheede, for the Indian Menianthes, which this in part resembles. The divisions of the corol may be called three-rvingert: they look as if covered with silver frost.
19. Chitraca.

Syn. Pat'lín Vakni, and all other names of Fire.
Vulg. Chita, Chití, Chitrá.
Linn. Blumbago of Sílán.
Cal. Perianth one-leaved, egg-oblong, tubular, five-sided ; rugged, interspersed with minute pedicelled glands, exuding transparent glutinous droplets; erect, closely embracing the tube of the corol; mouth five-toothed; base protuberant with the valves of the nectary.
Cor. one-petaled, funnel-form. Tiube five-angled, rather incurved, longer than the calyx. Border five-parted, expanding. Divisions inverse, eggoblong, pointed, somewhat keeled.
Nectary five-valved, pointed, minute, including the germ.
$\$_{\text {tam. }}$ Filaments five, thread-form, inserted on the valvelets of the nectary as long as the tube of the corol. Anthers oblong, oblique.

Pist. Gerne egged, very smail; at first, when cleared of the nectary, smooth; but assuming as it swells, five-angles. Style columnar, as long as the stamens. Stignaa five-parted, slender.
Per. none, unless we give that name to the fiveangled coat of the seed.
Seed one, oblong, obscurely five-sided, inclosed in a ccat.
Racemas viscid leafy. Calyx light green. Corol milkwhite. Anthers purple, seen through the pellucid tube. Leaves alternate, egged, smooth, pointed, half sheathing, partly waved, partly entire ; foralleaves similar, minute. Stem flexible (climbing) many-angled, jointed at the rise of the leaves. Root caustic; whence the name Vahni, and the like. Chitraca means attracting the mind; and any of the Indian names would be preferable to Plumbago, or Leadwort. The species here described, seems most to resemble that of Seilan; the rosy Plumbago is less common here : the joints of its stems are red; the bracts three'd, egzed, equal pointed, coloured. 20. Ca'malata':

Syn. Súryá-cánti or Sunshine, it H. H. M. t. 60.
Vulg. Cám-latí, Ishk-pïchah.
Lińn. "Ipomoea Quamoclit.
The plant before us is the most beautiful of its order, both in the colour and form of its leaves and flowers; its elegant blossoms are celestial rosy red, love's proper hue, and have justly procured it the name of Cimalatá, or Love's Creeper; from which I should have thought Quamoclit a corruption, if there were not some reason to suppose it an Ameri-
ean word. Cámalatá may also mean a mythological plant, by which all desires are granted to such as inhabit the heaven of Indra; and if ever flower was worthy of paradise, it is our charming Ipomoea. Many species of this genus, and of its near ally the Conzolvulus, grow wild in our Indian provinces; some spreading a purple light over the hedges, some snowwhite with a delicate fragrance; and one breathing, after sunset, the odour of cloves; but the two genera are so blended by playful nature, that very frequently they are undistinguishable, by the corols and stigmas: for instance, the Mundavalli, or Beautiful Climber, of Rheede (of which I have often watched the large spiral-buds, and seen them burst into full bloom) is called Ipomoea by Linneus, and Convolvulus (according to the Supplement) by $\mathrm{K}_{\text {(enig ; }}$; and it seems a shade between both. The divisions of the perianth are egg-oblong, pointed; free above, intricated below; its corol and tube, those of an Ipomoen ; its filaments of different lengths, with anthers arrowed, jointed above the barbs, furrowed halk-incumbent; the stigmuas, two globular heads, each globe an aggregate of minute roundish tubercles; the stem not quite smooth, but here and there bearing a few small prickles; the very large corol exquisitely white, with greenish ribs, that seem to act as muscles in expanding the contorted bud; its odour in the evening very agreeable; less strong than the primrose, and less faint than the lily. 'The clove-scented creeper, which blows in my garden at a season and hour when I cannot examine it accurately, seems of the same genus, if not of the sanfe species, with the Mundavalli.

## 21. Cadamba:

$\mathrm{Symi}^{1}$ Nipa, Priyaca, Halipriya.
Vulg. Cadamb, Cadam.
Linn. Oriental Nauclea.
To the botanical description of this plant I can add nothing, except that I always observed a minute five-parted calyx to each floret, and that the leaves are oblong, acute, opposite, and transversely nerved. It is one of the most elegant among Indian trees, in the opinion of all who have seen it, and one of the holiest among them in the opinion of the Hindus. The Poet Ca'lida's alludes to it by, the name of N゙ipa; and it may justly be celebrated among the beauties of summer, when the multitude of aggregate flowers, each consisting of a common receptacle, perfectly globular, and covered uniformly with gold-coloured florets, from which the white thread-form styles conspicuously emerge, exhibits a rich and singular appearance on the branchy trees decked with foliage charmingly verdant. The flowers have an odour, very agreeable in the open air, which the ancient Indians compared to the scent of new wine; and hence they call the plant Halypriya, or beloved by Halin, that is, by the third Ra'ma, who was evi-, dently the Bacchus of India.
22. Gandíra:

Syn. Samasht'hilà, Lavana-bhantáca.
Vulg. Lona-bhant; Ins; Salatiỳ̀.
Linn. Solanum. Is it the Verbasciom-leaved?
Cal. Perianth one-leaved, cup-form, or belled? obscurely five-cleft, downy, pale, frosted, perma-
nent. Divisions egged, erect, pointed, very villous.
Cor. One-petaled. Tube very short. Border fiveparted. Divisions oblong, pointed, expanding, villous.
Stam. Filaments five, most short in the mouth of the tube. Anthers oblong, furrowed, converging, nearly coalescent, with two large pores gaping above.
Pist. Germ roundish, villous. Style thread-form, much longer than the stamens. Stigma obtuseheaded.
Per. Berry roundish, dotted above, hoary, divided into cells by a fleshy receptacle, with two or three wings.
Seeds very many, roundish, compressed, nestling.
Leaves alternate, egg-oblong, pointed, rather wavy on the margin, delicately fringed with down; darker and very soft above, paler below, with protuberant veins, downy on both sides, mostly decurrent on the long hoary petiols.
Stem shrubby, scabrous with tubercles, unarmed. Flowers umbel-fascicled. Corols white. Anthers yellow. Peduncles and pedicels hoary with deciduous ffost.
THis plant is believed to coritain a quantity of lavana, or salt, which makes it useful as a manure; but the single word Bhantaica, vulgarly Bhaint, means the Clerodendrun, which (without being unfortunate) beautifies our Indian fields and hedges with its very black beroy in the center of a bright red expanding permanent calyx. The charming little
bird Chatráca, commonly called Chattarya, or Turt* tuni, forms its wonderful nest with a leaf of this downy Solanum, which it sews with the silk-cotton of the Seven-leaved Bombax, by the help of its delicate but sharp bill: that lovely bird is well known by the Linnican appellation of Mot acil la Sartoria, properly Sartrix; but the figures of it that have been published, give no idea of its engaging and exquisite beauty.
23. Samudraca:

Sy n. - Dhóla-samudra.
Vulg. Dhól-samudr.
Linn. Aquilicia; but a new species.
Cal. Perianth one-leaved, funnel-shaped, fivetoothed, short, the teeth closely pressing the corol; permanent.
Cor. Petals five, egg -oblong, sessible, greenis.1; acute, curved inwards, with a small angled concave appendage. Nectary tubular, fleshy, fiveparted, yellowish; divisions, egg-oblong, doubled, compressed like minute bags with inverted mouths; enclosing the germ.
Stam. Filaments five, smooth and convex externally, bent into the top of the nectary, between the divisions or scales, and compressing it into a globular figure. Anthers arrowed; the points hidden within the nectary, surrounding the stigma; the barbs without, in the form of a star.
Pist. Germ roundish. Style cylindric. Stigma obtuse. Per. Berry roundish, flattened, naveled, longitudinally furrowed, mostly five-celled.

Seeds solitary, three-sided, externally convex. Cymes mostly three-parted. Stem deeply channelled, jointed, two-forked. Pedruncles also jointed and channelled. Fructiffcation bursting laterally, where the stem sends forth a petiol. Berries black, watery. Leaves alcernate, except one terminal pair; hearted, pointed, toothed; twelve or fourteen of the teeth shooting into lobes; above, dark green; below, pale, ribbed with processes from the petiol, and reticulated with protuberant veins; the full-grown leaves above two feet long from the apex, and nearly as broad toward the base; many of them rather targetted. This new species may be called large-leaved, or Aquilicia Samudraca. Thespecies described by the younger Burman, under the name of the Indian Staphylea, is not uncommon at Crishna-nagar; where the peasants call it Cacajanghá, or Crow's foot: if they are correct, we have erroneously supposed the Cóing of the modern Berigalese to be the Caicangi of the ancient Hinclus. It must not be omited, that the stem of the Aquilicia Sambucina is also channelled, but that its fructification differs in many respects from the descriptions of Burman and Linifeus; though there can be no doubt as to the icentity of the genus.
24. So'marajfl:

Syn. Avalguja, Suballi, Sómaballicá, Cálaméshí, Crishnáphaláa Vúcuchì, Vikguji, Puıtip'hall..
Vulg. Sômáj, Bacuchiz.
Lixn. Fetid Pgederta.

The characters as in Linneus, with a few variations. Calyw incurved, Corol very shaggy within. Style two-cleft, pubescent; divisions contorted, Stem climbing, smooth. Leaves opposite, long-petioled; the lower ones oblong, hearted; the higher, eggoblong, veined, with a wavy margin. Panicles axillary (except the highest) cross-armed. Flowers beautiful to the sight, crimson, with milk-white edges, resembling the Dianthus, vulgarly called Sweet William, but resembling it only in form and colours; almost scentless to those who are very near it, but diffusing to a distance a rank odour of carrion. All the peasants at Crishna-nugar called this plant Somriij; but my own servants, and a family of Bra'lunens from Tribéni, gave that name to a very different plant of the ninetecnt class, which I took, on a cursory inspection, for a Prenanthes.
25. Sya'ma':

Syn. Gopi', Sa'riva', Anantlu, Ltpalesáriva, Gópa', Gonálica, Go'pavalli.
Vulg. Sya'ma'-latu'
Rheede; in Malabar letters, Puppa'l-valli.
Cal. Perianith one-leaved, five-toothed, erect, mínute, permanent.
Cor. One-petaled, salver-form. Tube itself cylindric, but protuberant in the middle with the germ and anthers; throat very villous. Border five-parted; divisions very long, lance-linear, spirally contorted, fringed, closed, concealing the fructification.

Stam. Fituments, if any, very short. Anthers, five, awled, erect, converging at the top.
Рist. Germ above, pedicelled, spheroidal, girt with a nectareous ring. Style thread-form, rather awled. Stigma simple.
Per. Capsule one-celled; one-seeded, roundish, hispid.
Seed oval, very minute, glossy.
Flozvers raceme-panicled, greenish-white, very small, scented like those of the hawthorn, but far sweeter; and thence the Portuguese called them honey-flowers.
Peduncles axillary, russet; pedicles many-flowered. Branchlets milky. Leaves opposite, lance - oval, pointed at both ends, most entire veined; above, dark green; below, pale. Slipules linear, axillary, adhering. Stem climbing, round, of a russet hue, rimmed at the insertion of the short petiols.
The ripe fruit of this elegant climber, which Ca'lida's mentions in his poem of the Seasons, has been seen by me only in a very dry state; but it seemed that the hispid appearance of the capsulcs, or berries, which in a microscope looked exactly like the burrs in Van Rheede's engraving, was caused by the hardened calyxes and fringe of the permanert corols; the seeds in each burr were numerous, and like black-shining sand; for no single pericarp could be disengaged from it; and it is described as oneseeded merely from an inspection of the dissected germ. Before I had seen the fruit, I thought the Sya'ma very nearly connected with the Shrubley Apo-
cynum, which it resembles in the leares, and in parts of the corol.

Five of the Sanscrit names are strung together, by the author of the Amaracoosh, in the following verse:

Goópi' sya'ma' sarivá syádanato'tpala sariva':
and his commentator observes, that the last name was given to the S'ariva from the resemblance of its flowers to those of the Utpala, which I thence conclude to be a Menianthes, especially as it is always described among the Indian Water-plants. The other synonymous words are taken from Va'chaspati.
26. A'vigna, or Avinga:

Syn. Crishnapácap’hala, Sushénas, Caramardaca.
Vulg. Caróndà, or Caraundì in two dictionaries; in one, Pániamaľ̀.
Linn. Carissa Carandas.
Cal. Perianth five-cleft, acute, very small, coloured, persistent.
Cor. One-petaled, funnel form. Tiube longish; throat swoln by the inclosed anthers. Border fiveparted; divisions oblong; one side of each embracing the next.
Stam. Filaments five, extremely short. Authers oblong, erect.
Pist. Germ above, roundish. Slyle thread -form, short, clubbed. Stigma narrower, pubescent.
Per. Berry elliptoïdal, two-celled. Seens, at least seven, oval, compressed, margined. Flowers milk-white, jasmin-like. Fruit beautiful
in form and colour, finely shaded with carmine and white; agreeably acid. Branches two-forked. Leaves opposite, short petioled, elliptic, obtuse, most entire, smooth; some small leaves roundish inverse hearted. Thorns axillary, opposite, expanding; points bright red. Peduncles twin, subterminal, three-flowered; pedicels equal. The whole plant, even the fruit, milky. We have both species of Carissa in this province ; but they melt, scarce distinguishably, into each other.
The Pandits have always brought me this elegant plant as the Carcandu, mentioned by Jayade'va; but, judging only by the shape and taste of the fruit, they seem to confound it with the Rhamnus $J_{u j u b a}$; and the confusion is increased by the obscurity of the following passage in their best vocabulary :

Carcandhui, vadarí, cóli'; cólam, cuvala plienilé, Sauviram, vadaram, ghónti- ————

All agree, that the neuter words meãn fruits only; but some insist, that the Ghonta' is a distinct plant, thus described in an ancient verse: 'The gho'nta', - called also gópaphointa, is a tree shaped like the - Vadari, with a very small fruit, growing only in ' forests.' For the ghonta', here known by the name of Séhacul, my servants brought me Rhamnus with leaves alternate egg-oblong, three-nerved, obscurely sawed, paler beneath, and most beautifully veined; floral young leaves crowded, very long, linear; frickles often solitary; sometimes paired, one straight,
straight, one curved; a small globular drupe, quite black, with a one-celled nut: the flowers I never saw perfect; but it seems the nineteenth species of Linneus. We have many species of Phamnus in our woods and hedges; some like the Alaternus, polygamous by male and hermaphrodite flowers; others, distinguished by various forms and positions of the prickles and leaves; but the common Badari or Baiar, is the Jujube-lree, described by Rhede; and by Rumphius called Indian Apple-tree. Its Persion name is Cona'r ; by which it is mentioned in the letters of Pietro della Valle, whotakes notice of the soapy froth procured from its leaves; whence it has in Sanscrit the epithet p'hénila, or frothy. To the plant the Arabs give the name of Sidr, and to its fruit that of Nabik; from which perhaps, Napeca has been corrupted.

## 27. Caravira:

Syn. Pratitu'sa, Satapraisa, Chandáta, Hayama'rac̃a. Linn. Nerium Oleander, and other species. Vulg. Canér, Carbír.

A plant so well known would not have been inserted in this place, if it had not been thought proper to take notice of the remarkable epithet hayama'raca, or horse-killer; which rose from an opinion still preserved among the IIindus, that a horse, unwarily eating the leaves of the Nerium, can hardly escape death : most of the species, especially their roots, have strong medicinal, but probably narcotic powers. The blue-dying Nerium grows in woods at a little distance from my garden; and the Hindiu peasants, who brought it me, called it $\mathrm{Ni}^{\prime} \mathrm{l}$, or blue:
a proof
a proof that its quality was known to them, as it probably was to their ancestors, from time immemorial.
28. Septaperna, or seven-leaved:

Syn. Visála-twach, Síradi, Vishama-chihada.
Vulg. Cli'hitavani, Ch'ha'tiya'n, Ch'ha'ton.
Linn. School Echites.
Cal. Perianth five-parted, sub-acute, small, villous, pormanent; closing round the germ immediately on the removal of the tube.
Cor. One-petaled, funnel-form. Tube cylindric below, prominent above, with inclosed anthers, very villous in the throat. Border five-parted, shorter than the tube : divisions inverse-egged, obtuse, oblique, reflected, waved on the margin.
Neítary, a circular undivided coronet, or rim, terminating the tube, with a short erect villous edge.
Stam. Filaments five, cylindric very short in the throat of the tube, Anthers heart-harrowed, cleft, pointed, forming a star, visible through the mouth of the tube, with points diverging.
Pist. Germ above roundish-egged, very villous, scarce extricable, from the calyx enclosing and grasping it. Style cylindric, as long as the tube. Stigma two-parted, with parts diverging, placed on an irregular orblet.
Per. Follicles two, linear, very long, one-valved. SEEDS numerous, oblong, compressed with silky pappus, pencilled at both ends.

## NOTE.

The whole plant milky. Stem dotted with minute whitish tubercles. Leaves mostly sevened in verticils at short distances, very soft, oblong inverse-egged, some puinted, some obtuse, some end-nicked; some entire, some rather scallopped; with many transverse parallel veins on each side of the axis; rich dark green above, diluted below. Petiols furrowed above, smooth and cone ves, beneath, elongated into a strong protuberant nerve continually dininuishing and evanescent at the apex. Stipules above erect, acute, set in a coronet round the stem; the verticils of the leaves answering to the definition of fronds. Flowers rather small, greenish white, with a very particular odour, less pleasant than that of elder-fiowers. Peduncles terminal, with two verticils pedicelled umbel-wise, but horizontal. Pedicels six-headed, many-flowered ; highest verticils similar to those heads, more crowded. Tree wery large when full grown; light and elegant when young. This plant so greatly resembles the Pala of Van Rheede (which has more of the Nerium than of the Tabernemontana) that I suspect the genus and species to be the same, with some little variety. That author says, that the Brabsmens call it Santenu, but his Nagari letters make it Savánu; and neither of the words is to be found in Sanscrit. With all due respect for Plumier and Buruan, I should call this plant Nerium Septaparna: it is the Fule of Rumphivs, who enumerates its various uses at great length and with great confidence.
29. Arca:

Syn. Vasuca, Asp’hóta, Gonárúpa, Vicirana, Mandára, Arcaperna; and any name of the Surn.
Vulg. A'cand, A'nc.
Linn. Gigantic Asclepias.
Nectaries with two-glanded compressed folds, instead of awoled hornlets at the summit; spirally eared at the base. Filaments twisted in the folds of the nectaries. Anthers flat, smooth, rather wedge - form. Styles near half an inch long, subcylindric.
cylindric. Stigmas expanded. Flowers terminal and axillary umbel - fascicled; amethyst - coloured, with some darker shades of purple on the petals and nectaries; the starred corpuscle bright yellow. Jeaves opposite, heart oblong, mostly inverse-egged, subtargeted, very rarely stem-clasping, pointed, villous on both sides, hoary beneath, with soft down; peiiols very short, concave and bearded above, with a thickish conical stipule. The whole plant filled with caustic milk. A variety of this species has ex́quisitely delicate milk-white flowers; it is named Alarca or Pratápsa, and highly esteemed for its antispasmodic powers. The Padinárca, which I have not seen, is said to have small crimson corols. The individual plants, often examined by me, vary considerably in the forms of the leaves and the tops of the nectary. 30. Pichula: Syn. Jhíwaca.
Vulg. J'hau. Koen. Indian Tamarix?
Flowers very small, whitish, with a light purple tinge, crowded on a number of spikes, which form all together a most elegant panicle. Stem generally bent, often straight, and used anciently for arrows by the Persians, who call the plant Gaz. The celebrated shaft of ISFENDIYA'R was formed of it, as I learned from Bahmen, who first showed it to me on a bank of the Ganges, but asserted that it was common in Persid. The leaves are extremely minute, sessile, mostly imbricated. Calyx and corol Vol.IV.

T
as described by Linnetus; five filaments considerably longer than the petal; anthers lobed, furrowed; germ very small; style scarce any; stig. mas three, revolute, but, to my eyes, hardly feathered.
Nothing can be more beautiful than the appearance of this plant in flower during the rains, on the banks of the rivers, where it is commonly interwoven with a lovely twining Asclepias, of which the following description is, I hope, very exact :
3I. Dugdicicá: or Milk-plant.
Syn. Cshíráví Dugdhicá.
Vulg. Kyirui, Dúdhi, Dúdh latá.
Linn. Esculent Periploca.
Cal. One-leaved, five-parted; divisions awled, acute, coloured, expanding.
Cor. One-petaled, salver-form, star-like, divisions five, egged, pointed, fringed.
Nectary double, on a five-cleft base, gibbous between the clefts, protuded, and pointed above, surrounded with a bright green villous rim : exterior fiveparted; divisions egged, converging, attenuated into daggers; each concave externally, gibbous below the cavity, which is two-parted and wrinkled within. Interior a five-parted corpuscle, lopped above, five-angled, surrounding the fructification.
Stam. Filaments scarce any. Anthers five, roundish, very minute, set round the summit of the lopped corpuscle.
Pist. Germs two, egged, pointed, erect, internally
flat. Styles none, unless your so call the points of the germs. Stigma; none but the interior nectary, unless you consider that as a common stigma.
Per. Follicles two, oblong; in some, pointed; in others, obtuse ; inflated, one-valved ; each containing a one-winged receptacle:
Seeds numerous, roundish, compressed, crowned with pappus.
To each pair of leaves, a peduncle mostly two-flowcred, often with three, sometimes with five, flowers. Calyw reddish. Corot white, elegantly marked with purple veins; fringe white, thick; anthers black. Leaves linear-awled, pointed, opposite, petioled, with ene strong nerve; stipules very soft, minute. Stem smooth, round, twining; the whole plant abounding with milk.
32. La'ngalí:

Syn. Saradz̀, Tóyapippati, Saculíduǹ̀,
Vulg. Cínchrì, Isholángolyá.
Rheéd. Chéru-vallél?
Linn. Nama of Silán.
Cal. Perianth one-leaved, five-parted, villous; divisions lanced, pointed, long, permanent.
Cor. One petaled, nearly wheeled. Tibe very short. Border five-parted. Divisions egged.
Stam. Filaments five, awled, expanding; from the mouth of the tube, adhering to the divisions of the border by rhomboidal concave bases convergent above. Anthers large, arrowed.
Pist. Germ above, egg-oblong, two-cleft. Styles T 2 two,
two, azure, funnel-form, diverging almost horizontally. Stigmas lopped, open.
Per. Capsule many-seeded.
Sedds very minute.
Stem herbaceous, branchy, smooth, pale, creeping. Leaves alternate, short-petioled, most entire, lanceoblong, smooth, acutish. Peduncles mostly axillary, sometimes terminal, villous, often manyflowered, subumbelled, three-rayed, with involueres general and partial. Corols bright-blue, or violet. Stamens white. The plant is aquatic, and by no means peculiar to Silim: I have great reason, however, to doubt, whether it be the Linngali of the Amaracish, which is certainly the Canchive of Bengall; for though it was first brought to me by that name, yet my gardener insists that Canchrie is a very different plant, which, on examination, appears to be the Ascending Jussieua of Linneus, with leaves inverse-egged, smooth, and peduncles shorter: its fibrous, creeping roots are purplish, buoys white, pointed, solitary; and at the top of the geim sits a nectary composed of five shaggy bodies, arched like horse-shoes, with external honey-bearing cavities.
33. UMA':

Syn. Ataśs, Cshumár.
Vule. Tisì, Masaná.
Linn. Most common Linutm.
Cal. Perianth five-leaved; leaflets oblong, acute, iinbricated, keeled, fringed minutely, having somewhat reflected at the points.

Cor. Small, blue: petals notched, striated, wavy, reflex, imbricated.
Stam. Anthers light blue, converging, no rudiments of filaments.
Pist. Germlarge. Style pale blue. Stigna simple.
Per. Capsule pointed. Furrowed.
Root simple.
Stem. Herbaceous, low, erect, furrowed, knotty? maked at the base.
Leaves linear, three-nerved, alternate crosswise, sessile, smooth, obtuse, reflected, stipuled, glanded?
Sripules linear. Q. a minute gland at the base.
34. Mu'rvá:

Syn. Dévì, Madhurasá, Mórata', Téjani, Surva', Madhúlica', Madhus'rénѝ, Gòcarnì, Pìluparnı̀.
Vulg. Muragà, Muraharù, Murga'bi.
Linn. Hyacintioüd, Aletras.
Cal. None.
Cor. One-petaled, funnel-form, six-angled. Tube short, bellied with the germ. Barder six-parted. Divisions lanced; three quite reflected in a circle ; three alternate, deflected, pointed,
Stam. Filaments six, awled, as long as the corol, diverging, inserted in the base of the divisions. Anlthers oblong, incumbent.
Misf. Germ inverse-egged, obscurely three-sided, with two or three honey-bearing pores on the flattish top. Style awled, one-furrowed, as long as the stamens. Stigma clubbed.
Pericarp and Sfeds not yet inspected.

Root fibrous, tawny, obscurely jointed, stolonbearing. Scape long, columnar, sheathed with leaves, imbricated from the root; a few sheaths above, straggling. Leaves fleshy, channelled, sword-form, keeled, terminated with awls, the interior ones longer, mostly arched, variegated with transverse undulating bands of a dark green hue approaching to black.
Raceme erect, very long. Flowers, from three to seven in each fascicle, on very short petiols. Bracts linear, minute. Corols pale pea-green, with a delicate fragrance, resembling that of the Perivian Heliotrope; some of the Sanscrit names allude to the honey of these delicious flowers; but the nectareous pores at the top of the germ are not very distinct; in one copy of the Amaracosha we read Dhanuh-s'reni among the synonyma; and if that word, which means a series of bowes, be correct, it must allude either to the archect leaves or to the reflected divisions of the corol. This AleTRIS appears to be a night-flower; the raceme being covered every evening with fresh blossoms, which fall before sun-rise.
From the leaves of this plant, the ancient Hindus. extricated a very tough elastic thread, called Maurvi, of which they made bow-strings, and which, for that reason, was ordained by MENU to form the sacrificial zone of the military class.
35. Taruni:

Syn. Sahci, Cuma'rí.
Vulg. Ghrita-cuma'ri.

Linn. Two-ranked Aloe, A Perfoliata, P?
Flowers racemed, pendulous, subcylindric, rather incurved. Bracts, one to each peduncle, awled, concave, deciduous, pale, with three dark stripes. Corol six-parted; three external divisions, orangescarlet; internal, yellow, keeled, more fleshy, and more highly coloured in the middle. Filaments with a double curvature. Germ six-furrowed. Stigma simple. Leaves awled, two-ranked; the lowest expanding; sea-green, very fleshy; externally quite convex, edged with soft thorns; variegated on both sides with white spots. Vas Rheede exhibits the true Aloe by the name of Cumárí; but the specimen brought me by a native gardener, seemed a variety of the two-ranked, though melting into the species, which immediately precedes it in Linnxus,
36. Bacula:

Syn. Césára.
Vulg. Mulsarí, or Milasrí.
Lynn. Mimusops Elengi.
Cal. Perianth eight-leaved; leaflets egged, acute, permanent; four interior, simple; four exterior, leathery.
Cor. Petals sixteen, lanced, expanding; as long as the calyx; Nectary eight-leaved; leaflets lanced, converging round the stamen and pistil.
Stam, Filaments eight (or from seven to ten) awled, very short, hairy. Anther's oblong, erect.
Pist. Germabove, roundish, villous. Style, cylindric. Stigma obtuse.
Per. Drupe oval, pointed; bright orange-scarlet.

Nur oval, wrinkled, flattish, and smooth at one edge ; broad and two-furrowed at the other.
Flower's agreeably fragrant in the open air, but with too strong a perfume to give pleasure in an apartment. Since it must require the imagination of a Burman to discover in them a resemblance to the face of a man, or of an ape, the genus will, I hope, be called Bacula; by which name it is frequently celebrated in the Pura'uas, and even placed among the flowers of the Hindu paradise. Leaves alternate, petioled, egg-oblong pointed, smooth. The tree is very ornamental in parks and pleasuregrounds,
37. As'óca:

Syn. Vanjulta.
C'al. Perianth two-leaved, closely embracing the tube.
Cor. One-petaled. Tube long; cylindric, subincurved; mouth encircled with a nectareous rim. Border four-parted; divisions, roundish.
Stan. Filaments eight, long, coloured, inserted on the rim of the tube. Anthers kidney-shaped.
$\mathrm{P}_{1 \text { ș }}$. Germ above, oblong, flat. Style short, downy. Stigma bent, simple:
Per. Lergume long, compressed at first, then protuberant with the swelling seeds; incurved, strongly veined and margined, sharp-pointed.
Seeds from two to eight, solid, large, many-shaped, some oblong-roundish, some rhomboidal, some rather kidney-shaped, mostly thick, some flat. Leaves egg-oblong-lanced, opposite, mostly five-paired, nerved;
nerved; long, from four or five to twelve or thirteen inches.
The number of stamens varies considerably in the same plant: they are from six or seven to eight or nine ; but the regular number seems eight, one in the interstices of the corol, and one before the centre of each division. Most of the flowers, indeed, have one abortive stamen, and some only mark its place, but many are perfect; and VaN RHEEDE speaks of eight as the constant number: in fact no part of the plant is constant. Flowers fascicled, fragrant just after sun-set, and before sunrise, when they are fresh with the evening and morning dew ; beautifully diversified with tints of orangescarlet, of pale yellow, and of bright orange, which grows deeper every day, and forms a variety of shades according to the age of each blossom that opens in the fascicle. The vegetable world scarce exhibits a richer sight than an $A s o^{\prime} c a$-tree in full bloom: it is about as high as an ordinary cherrytree. A Bra'hman informs me, that one species of the $A s^{\prime} c a$ is a creeper; and Jayade'va gives it the epithet voluble: the Sanscrit name will, I hope, be retained by botanists, as it perpetually occurs in the old Indian poems, and in treatises on religious rites,
38. S'aiva'la:

Syn. Janalitio S'aivafo.
Vulg. Simár, Syála', Pa'tasya'la, Séha'la'.
Lynf. Vallisneria? R.
Cal. Common Spatic one-leaved, many-flowered,
very long, furrowed, two-cleft at the top; each division end-nicked. Proper Perianth three-parted; divisions awled.
Cor. Petals three, linear, long, expanding, fleshy. Stam. Filuments invariably nine, thread-form. Anthers erect, oblong, furrowed.
Pist. Geim egged, uneven. Sbyles always three, short, awled, expanding. Stigmas three, simple.
Per. Capsule very long, smooth, awled, one-celled, infolded in an angled Spathe.
SEEDS very numerous, murexed, in a viscid mucus.
Flowerets from six to fouricen, small. Scape compressed, very narrow, hleshy, furrowed in the middle.
Pedicel of the floweret thread-form, crimson above; proper perianth, russet; petals white; anthers deep yellow. Leaves sword-form, pointed, very narrow, smooth, and soft, about two feet long, crowded, white at the base. Root small, fibraus. Ir flourishes in the ponds at Crishna-nagar. The refiners of sugar use it in this province. If this plant be a Vallisneria, I have been so unforturate as never to have seen a female plant, nor fewer than nine stamens in one blossom out of more than a hundred, which I carefully examined.
39. Pu'ficaraja:

Syn. Pracírya, Puitica, Calimáraca.
Vulg. Náta'caranja.
Linn. Guilandina Bonduccilla.
The species of this genus vary in a singular manner : on several plants, with the oblong leaflets and double prickles of the Bonduccella, I could see only male
flowers as Rheede has described them; they were yellow, with an aromatic fragrance. Others, with similar leaves and prickles, were clearly polygamous, and the flowers had the following character.

MALE.
Cal. Perianth one-leaved, salver - form, downy; Border five-parted, with equal, oblong divisions. Cor. Petals five, wedge-form, obtusely notched at the top ; four equal, erect, the fifth depressed. Stam. Filcoments ten, awled, inserted in the calyx, villous, very unequal in length. Anthers oblong, furrowed, incumbent.

## HERMAPHRODITE.

Calyx, Corol, Stamens, as before.
Pist. Gerni oblong, villous. Style cylindric, longer than the filaments. Stigma simple.
Per. and Seeds well described by Linneus.
Flowers yellow; the depressed petal variegated with red specks. Bracts three-fold, roundish, pointed. Spikes set with floral leaflets, lanced, four-fold, reflected. 40. Sobhánjana:

Syn. Sigrill, Ticsitina, Gandhaca, Acshi'va, Móchaca.
Vulg. Sajjana, Moranga.
Linn. Guilendina Moringa.
Cal. Perianth one-leaved. Tube short, unequal, gibbous. Border five-parted. Divisions oblonglanced, subequal ; first deflected, then revolute; coloured below, white above.
Cor. Petals five, inserted into the calyx, resembling a boat-formi flower. Wing-like, two, inverse-egged, clawed, expanding.

Avoning-like, two, inverse-egged, erect; claws shorter.
Keel-like, one, oblong, concave; enclosing the fruc* tification; beyond it, spatuled; longer than the wing-petals.
Stam. Filaments five, fertile; three bent over the pistil : two shorter, inserted into the claws of the middle petals. Anthers twin, rather mooned, obtuse, incumbent. Five steril (often four only) alternate with the fertile, shorter; their bases villous.
Pist. Germ oblong, coloured, villous; below it a nectar-bearing gland. Style shorter than the stamen, rather downy, curved, thicker above. Stignia simple.
Per. Legume very long, slender, wreathed, pointed, three-sided, channelled, prominent with seeds, onecelled.
Seeds many, winged, three-sided.
Tree very high; lranches in an extreme degree light and beautiful, rich with clustering flowers. Stem exuding a red gum. Leaves mostly thricefeathered with an odd one; leafleis some inverse. egged, some egged, some oval, minutely end.nicked. Raceme-panicles mostly axillary. In perfect flowers the whole caylx is quite deflected, counter. feiting five petals; whence Van Rheede made it a part of the corol. Corols delicately odorous; milkwhite, but the two central erect petals beautifully tinged with pink. The root answers all the purposes of our horseradish, both for the table
and for medicine; the fruit and blossoms are dressd in caris. In hundreds of its flowers, examined by me with attention, five stamens and a pistil were invariably perfect; indeed, it is possible, that they may be only the female hermaphrodites, and that the males have ten perfect stamens with pistils abortive; but no such flowers have been discovered by me after a most diligent search.
There is another species or variety, called Mexhu Si'gru, that is Honey-Sigrtu; a word intended to be expressed on Van Rheede's plate in Nagari letters; its vulgar name is Muna, or Racta sajanu, because its flowers or wood are of a redder hue.

Linneus refers to Mrs. Blackiwell, who represents this plant by the name of Balunus Myrepsica, as the celebrated Ben, properly Bain, of the Arabian physians and poets:
4r. Cóvidatra:
Syn. Cänchanàra, Chamarica, Cuddầla, Yugapatra.
Vulg. Cachna'r,' Racta cárchan.
Linn. Variegated Bauhinia.
Cal. Perianth one-leaved, obscurely five-cleft, deciduous.
Cor. Petals five, egged, clawed, expanded, wavy' ; one more distant, more beautiful, striated:
Stam. Filaments ten, unequally connected at the base; five shorter, Anthers double, incuinbent.
Pist. Germ above, oblong. Style incurved: Stigma simple, ascending.
Per. Legume flattish, long, pointed, mostly fivecelled.

SEEDS

Seeds mostly five; compressed, wrinkled, roundish.
Leaves rather hearted, two lobed; some with rounded, some with pointed, lobes. Flowers chiefly purplish and rose-coloured, fragrant; the sweet and beautiful buds are eaten by the natives in their savoury messes. We have seen many species and varieties of this charming plant : one had racemed flowers, with petals equal, expanding, lanced, exquisitely white, with a rose-coloured stripe from the base of each to its centre ; anthers four only, fertile; six much shorter, steril; a second had three fertile, and seven very short, barren; ano* ther had light purple corols, with no more than five filaments, three longer, coloured, curved, in a line of beauty. A noble Climbing Bauhinia was lately sent from Nepál; with flowers racemed, cream-coloured; style pink; germ villous: stamens three filaments, with rudiments of two more; stem downy, four-furrowed, often spirally. Tendrils opposite, below the leaves. Leaves twolobed, extremely large: it is a stout climber up the highest Arundo Vimu. The Sanscrit name Mandara is erroneously applied to this plant in the first volume of Van Rheede.

## 42. Capitt'Ha:

Syn. Gráhin, Dadhitt'ha, Manmat'lut, Dadtup'hala, Pushpap'hala, Dantas'at'ha.
Vulg. Cat'h-bél.
Koen. Crateva, Valanga.
CaI. Perianth five-parted, minute, deciduous; divisions expanded, acute.

Cor. Petals five, equal, oblong, refleqted:
Stam. Filaments ten, véry short, with a small gland between each pair, awled, furrowed. Anthers thick, five times as long as the filaments; furrowed, coloured, erect-expanding.
Pist. Germ roundish, girt with a downy coronet. Style cylindric, short. Stigma simple.
Per. Berry large spheroidal, rugged, often warted externally, nerted within; many seeded.
Seeds oblong-roundish, flat, woolly, nestling in five parcels, affixed by long threads to the branchy receptacles.
Flowers. axillary, mostly toward the unarmed extremity of the branch. Divisions of the Perianth with pink tips; petals pale; anthers crimson, or covered with bright yellow pollen. Fruit extremely acid before its maturity; when ripe, filled with dark brown pulp, agreeably subacid. Leaves jointedly feathered with an odd one; leaflets five, seven, or nine; small, glossy, very dark on one side, in-verse-hearted, obtusely-notched, dotted round the margin with pellucid specks, very strongly flavoured and scented like anise. Thorns long, sharp, folitary, ascending, nearly cross-armed, axillary, three or four petiols. to one thorn. Kleinhoff limits the height of the tree to thirty feet, but we have young trees forty or fifty feet high; and at Bandell there is a full-grown Capitt'ha equal in size to the true Bilva; from its fancied refemblance to which the vulgar name has been taken. When the trees flourish, the air around them breathes the odour
of anise, both from the leaves and the blossoms $\hat{3}$ and I cannor help mentioning a singular fact which may indeed have been purely accidental : not a single flower, out of hundreds examined by me, had both perfect germs and anthers visibly fertile, while others, on the fame tree and at the same time, had their anthers profusely covered with pollen, but scarce any styles; and germs to all appearance abortive.
43. Cuvéraca:

Syn. Tunna, Tuni, Cachiha, Cántalaca, Cuni, Nardivricsha.
Vulg. Túni, Tún; absurdly Filaryatì Nim.
Lina. Between Cedrela and Swietenia.
Cal. Perianth one-leaved, five-cleft, minute, deciduous; divisions roundish, concave, villous, expanding.
Cor. Rather belled. Petals five, inverse-egged, obtuse, concave, erect, white with a greenish tint, three exterior lapping over the two others. Nectary short, five parted; divisions roundish, orange-scarlet, bright and concave at the insertion of the stamens, rather downy.
Sta,M. Fildments five; inserted on the divisions of the nectary, awled, somewhat converging, nearly as long as the style. Anthers doubled, some three-parted, curved, incumbent.
Pist. Germ egged, obscurely five cleft Style awled, erect, rather longer than the corol. Stigma broad-headed, fat, bright, green, circular, starred.

Per. Capsule egged, five-celled, woody, gaping at the base. Receptacle five-angled.
Seeds imbricated, winged.
Leaves feathered, scarce ever with an odd one; pairs from six to twelve; petioles, gibbous at their insertion, channelled on one side, convex and smooth. on the other. Stipules thick, short, roundish; leaflets oblong-lanced, pointed, waved, veined, nerve on one side. Panicles large, diffuse, consisting of compound racemes. Nectaries yielding a fine yellow dye. Wood light, in colour like $M a$. hagoni.
44. Nichula:

Syn. Ambuja, Ijjala.
Vulg. Hijala, Badia, Jyúli.
Cal. Perianth one-leaved, belled, fleshy, downy, coloured, permanent, five-parted; divisions erect, pointed.
Cor. Five-petaled; petals egged, short pointed, revolute, downy within and without.
Stam. Filaments ten, five mostly shorter; inserted in the bell of the calyx; awled, villous. Anthers erect, oblong, furrowed.
Pist. Germ egg-oblong, very villous. Style threadform, curved. Stigma headed, with five obtuse corners.
Per. Drupe subglobular.
Nut scabrous, convex on one side, angled on the other.
Leaves feathered; pairs, from five to nine; leafets oblong, daggered, notched. Calyw pale pink. Corol
Vol. IV.
U
darker
darker pink without, bright yellow within. Cyme terminal, spreading.
45. Atimucta:

Sy x. Pun'draca, Vàsantí, Mádhavilatâo
Vulg. Mádhavilutà.
Linn. Bengal Banisteria.
Rheede: Dervenda, 6 H. M. tab. 59.
Cali $^{\text {a }}$ Perianth one-leaved, five-parted, permanent divisions coloured, oblong-oval, obtuse; between two of them a rigid glossy honey-bearing tubercle, hearted, acute.
Cor. Five-petaled, imitating a boat-form corol. $I F$ ings, two petals, conjoined back to back, involving the nectay, and retaining the honey.
Areming, large concave, more beautifully coloured. Keel, two petals, less than the wings, but similar. All five roundish, elegantly fringed, with reflected margins, and short oblong claws.
Stam. Filuments ten; one longer. Anthers oblong, thickish, furrowed.
Pist. Gerns two, or three, coalesced. Style one, thread-form, incurved, shorter than the longest filament. Stigma simple.
Per. Capsules two or three, mostly two, coalesced back to back; each keeled, and extended into three oblong membranous roings, the lateral shorter than the central.
Seeds roundish, solitary,
Racemes axillary. Flowers delicately fragrant; white, with a shade of pink; the large petal supported by the nectareous tubercle, shaded internally with bright
bright yellow and pale red. Bracts linear; Wiugs of the seed light brown ; the long one russet. Leaves opposite, egg oblong, pointed. Petiols short. Stipules linear, soft, three or four to each petiol. Two glands at the base of each leaf. Stem pale brown, ringed at the insertion of the leaves, downy.
This was the favourite plant of Sacontala, which she very justly called the Delight of the Woods; for the beauty and fragrance of its flowers give them a title to all the praises which $C_{A}^{\prime}$ LID A's and Jayade'va bestow on them: it is a gigantic and luxuriant climber ; but, when it meets with nothing to grasp, it assumes the form of a sturdy tree, the highest branches of which display, however, in the air their natural flexibility and inclination to climb. The two names, Vásanti and Mádhavi, indicate a reernal flower; but I have seen an Atimucta rich both in blossoms and fruit on the first of January. 46. 'Amra'taca:

Sin. Pìtana, Capítanáo.
Vulg. A'mda', pronounced A'mra, or $A^{\prime} m l a ́ a$.
Linn. Spondias Myrobalan $\beta$. or a new species.
The natural character as in Linneus. Leaves feathered with an odd one; leaflets, mostly five paired, egg-oblong, pointed, margined, veined, nerved; common petiol smooth, gibbous at the base. Flowers raceme-panicled, yellowish white. Fruit agreeably acid; thence used in cookery. Van Rheedecalls it Ambadò or Ambralam; and, as he describes it with five or six styles, it is wonderful that Hill should have supposed it a Chrysobalamus.

$$
\mathrm{U}_{2} \quad 47 \cdot \mathrm{HE}^{\prime} \mathrm{MA}^{2}
$$

47. He'masa'gara, or the Sea of Gold.

Vulg. Himságar.
Linn. Jagged-leaved Cotyledon.
Cal. Periunth four-cleft; divisions acute.
Cor. One-petaled: Tube four-angled, larger at the base; border four-parted; divisions egged, acute. Nectary one minute, concave scale at the base of each germ.
Stam. Filaments eight, adhering to the tube; four just emerging from its mouth; four alternate, shorter. Anthers erect, small, furrowed.
Pist. Germs four, conical. Styles, one from each germ, awled, longer than the filament. Stigmas simple.
Per. Capsules four, oblong, pointed, bellied, one valved, bursting longitudinally within.
Seeds numerous, minute.
Panicles terminal. Flowers of the brightest gold-colour. Leares thick, succulent, jagged, dull sea-green. Stem jointed, bending, in part recumbent. This plant flowers for many months annually in Bengal: in one blossom out of many, the numbers were ien and five; but the filaments alternately long and short.
48. Madhu'ca:

Syn. Gurapushpa, Madhudruma, Vinaprast'ha, Mad- $^{\text {y }}$ lucsht'hila, Madhu.
Velg. Maiiyyála, Mahzýá, Maliecóá.
Linn. Long-leaved Bassia.
49. Cahlára*:

* According to the sacred Grammar, this word was written Cablbára, and pronounced as Callara would be in ancient British. When the flowers are red, the plant is called Hallaca and Racta sazdhaca.

Sin. Sangrandhica, or Sweet-scented.
Vule. Sundhi'-háláa, or Sundhí-hálá-náli.
Linn. Nympizat Lotos.
Calyx as in the genus.
Cor. Petals fifteen, lanced, rather pointed and keeled ; the exterior series green without, imitating an interior calyx.
Stam. Filaments more than forty; below flat, broad; above nárrow, channelled within, smooth without; the outer series erect, the inner somewhat converging. Anther's awled, erect; some coloured like the petals.
Pist. Germ large, orbicular, flat at the top, with many (often seventeen) furrows externally, between which arise as many processes, converging toward the stigma; the disk marked with as many furrowed rays from the center, uniting on the margin with the converging précesses. Stigma roundish, rather compressed, sessile in the centre of the disk, permanent.
Per. Berry in the form of the gesm expanded, with sixteen or seventeen cells.
Seeds very numerous, minute, roundish. Flower's beautifully azure, when full blown more diluted; less fragrant than the red, or rose-coloured, but with a delicate scent. Leaves radical, very large, subtargeted, hearted, deeply scollop-toothed. On one side dark purple, reticulated; on the other dull green, smooth. Petiols very smooth and long, tubular. The seeds are eaten, as well as the bulb of the root, called Sailuca; a name applied by

$$
U_{3} \quad \text { RHEEDE }
$$

Rheede to the whole plant, though the word $C_{a}^{\prime}$ ab mala, which belongs to another Linncean species of Nymphea, be clearly engraved on his plate in Nágari letters. There is a variety of this species with leaves purplish on both sides; flowers dark crimson, calycine petals richly coloured internally, and anthers flat, furrowed, adhering to the top of the filaments: the petals are more than fifteen, less pointed, and broader than the blue, with little odour.
The true Lotos of Egypt is the Nymphea Nilisfer, which in S'anscrit has the following names or epithets': Padma, Nalina, Aravindu, Mahotpala, Camala, Cuséshaya, Sahasrapatra, Sírasa, Pancéruha, Ta'marasa, Sarasiruha, Ra'jíva, Vis'aprasúna, Pushcara, Ambhórutha, Satapatra. The new-blown flowers of the rose-coloured Padma, have a most agreeable fragrance ; the white and ycllow have less odour: the blue, I am told, is a native of Cashmir and Persia. 50. Cifampaca:

Syn. Cha'mpéya, Hémapushpaca.
Vulg. Champac, Champá. Livn. Michelia.

The delineation of this charming and celebrated plant, exhibited by Van Rheede, is very correct, but rather on too large a scale: no material change can be made in its natural character given by LinNIEUS; bilt, from an attentive examination of his two species, I suspect them to be varieties only, and am certain that his trivial names are merely different ways of expressing the same word. The strong aromatic
aromatic scent of the gold-coloured Champac, is thought offensive to the bees, who are never seen on its blossoms; but their elegant appearance on the black hair of the Indian women is mentioned by Rumphies; and both facts have supplied the Sanscrit poets with elegant allusions. Of the wild Champat, the leaves are lanced, or lance-oblong; the rhree leaflets of the -calys green, oval, concave; the petals constantly six, cream-coloured, fleshy, concave, with little scent; the three exterior inverseegged ; the three interior more narrow, shortcr pointed, converging ; the anthers clubbed, closely set round the base of the imbricated germs, and with them forming a cone; the stigmas minute, jagged.

Both Mr. Marsden and Rumphius mention the blue Champac as a rare flower highly prized in Sumatioa and Java; but I should have suspected that they meant the Kempperia Bhichampac, if the Dutch naturalist had not asserted that the plant which bore it was a tree resembling the Champaca with yellow blossoms : he probably never had seen it; and the Bráhmens of this province insist, that it flowerò orly in paradise.
51. Dévadáru:

Syn. Sacrapaidapa, Pairibhadraca; Bhadradient,
Duhcilina, Pítadáru, Dáru, Púticásȟthba.
Vulg. Dévadár.
Linn. Most lofiy Unona.
52. Parnása:

Syn. Tulasi', Cat'hinjara, Cut'héraon; Frindá. Vulg. Tulosì, Tului.

It is wonderful that Rheede has exhibited no delineation of a shrub so highly venerated by the Hindus, who have given one of its names to a sacred grove of their Parriassus on the banks of the Yamunà: he describes it, however, in general terms, as resembling another of his Tolassis (for so he writes the word, though Tulasi be clearly intended by his Na'gari letters); and adds, that it is the only species repuled holy, and dedicated to the God Vishnu. I should, consequently, have taken it for the Holy Ocymum of Linnexus, if its odour, of which that species is said to be nearly destitute, had not been very aromatic and grateful; but it is more probably a variety of that species than of the Small-flowered, which resembles it a little in fragrance. Whatever be its Linncan appellation, if it have any, the following are the only remarks that I have yet had leisure to make on it.
Stem one or two feet high, mostly incurved above; knotty and rough below. Branchlets cross-armed, channelled, Leaves opposite, rather small, egged, pointed, acutely sawed; purple veined beneath, dack above. Petiols dark purple, downy. Racemes terminal; Flowers ver, ticilled three-fold or five-fold, cross-armed, wer ticils from seven to fourteen; Pedrucles dark purple, channelled, villous; bracts sessile, roundish, concave, seflected. Calyx with its upper lip or bicular,
bicular, deeply concave externally. Corol blueish purple. The whole plant has a dusky purplish hue approaching to black, and thence, perhaps, like the large black bee of this country, it is held sacred to Crishna; though a fable, perfectly Ovidian, be told in the Purainas concerning the metamorphosis of the nymph Tulasi, who was beloved by the pastoral God, into the shrub, which has since borne her name. It may not be improper to add, that the White Ocymum is in Sanscrit called Arjaca.
53. Pa'tali:

Srn. Pa'tala, Amóghù. Cáchastha'li, P'haléruhà, Crishmavinintì, Cuvéráchis. Some read Mógha' and Ca'la'stha'li'.
Vulg. Päralá, Pèrali, Párul.
Linn. Bignonia. Chelonoides?
Cal. Perianth one-leaved, belled, villous, withering, obscurely five-angled from the points of the divisions, five-parted; divisions roundish, pointed, the two lowest most distant.
Cor. One-petaled, belled. Tube very short; throat oblong-belled, gibbous. Border fiveparted; the two higher divisions reflected, each minutely toothed; convex externally; the three luzeer divisions, above, expanded; below, ribbed, furrowed, very villous. Palate nearly closing the throat. Nectary, a prominent rim, surrounding the germ, obscurely five-parted.
Stam. Filaments four or five, incurved, inserted below the uper division of the border, shorter
than the corol, with the rudiment of a fifth or sition, between two shorter than the rest. Antzers twocleft, incumbent at obtuse angles.
$P_{\text {Ist. }}$ Germ oblong-conical. Style thread-form, as long as the stamens. Stigma headed with two folds. often closed by viscidity.
Per. Capsule one-celled, two valved, twelve inches long at a medimm, and one inch thick; rounded, four-sided, pointed, incurved, rather contorted, diminished at both ends, dotted with ashy specks, Frere and there slightly prominent, striated; two stripes broader, very dark, at right angles with the valves.
Rec. A series of hard, broadish, woody rings, closely strung on two wiry central threads.
Seeds numerous, forty-eight on an average, threeangled, inserted by one angle in cavities between the rings of the receptacle, into which they are closely pressed by parallel ribs in the four sides of the capstule; iwinged on the two other angles with long subpellucid membranes, imbricated along the sides of the receptacle.
Tree rather large. Stem scabrous.
Branchlets cross-armed, yellowish green, speckled with small white lines. Leaves feathered with an add one; two or three paired, petioled. Leafiets opposite, egged, pointed, most entire, downy on both sides, veined; older leaflets roughish, margined, netted and paler below, daggered. Petiols tubercled, gibbous at the base; of the paired leaflers, very short; of the odd one, longer.
longer. Stipules linear. Flowers panicled; pedicels opposite, mostly three-flowered; an odd flower subsessile between the two terminal pedicels. Corol, externally, light purple above, brownish purple below, hairy at its convexity; internally dark yellow below, amerhystine above; exquisitely fragrant, preferred by the bees to all other flowers, and compared by the poets to the quiver of Ca'made'va, or the God of Love. The whole plant, except the root and stem, very downy and viscid. The fruit can scarce be called a silique, since the seeds are nowhere affixed to the sutures; but their wings indicate the genus, which might properly have been named Pierospermon: they are very hard, but enclose a white sweet kernel ; and their light-coloured summits with three dark points, give them the appearance of the winged insects. Before I saw the fruit of this lovely plant, I suspected it to be the Bignoxia Chelonoides, which Van Rheede calls Padri; and I conceived that barbarous word to be a corruption of Patali; but the pericarp of the true Patali, and the form of the seeds, differ so much from the Padri, that we can hardly consider them as varieties of the same species; alchough the specific character exhibited in the Supplement to Linnexs, corresponds very nearly with both plants.
The Pátali blossoms early in the spring, before a leaf appears on the tree, but the fruit is not ripe till the following winter.
54. Gócantacs:

Syn. Paluncósha', Icshugandha', S'wadanshtriv, Swáducantiaca, Gúcshuraca, Vanas'rniga'ta.
Vulg. Gócshura, Gókyura, Culpı̀.
Rheede: Bahél Chulli.
Linn. Long-leaved, Barleria?
Cal. Perianth one-leaved, hairy, five-toothed; upper tooth long, incurved, pointed; two under and two lateral shorter, subequal, winged with sub-pelIucid membranes.
Cor. One-petaled, two-lipped. Tube flattish, curved, protuberant at the mouth. Upper lip erect, two-parted, reflected at the sides, convave in the middle, enclosing the fructification. Under lip three-parted, reflected, with two parallel, callous, hispid bodies on the centre of its convexity; Divisions inversehearted.
Stam. Filaments four, inserted in the mouth of the tube; connected at their base, then separated inta pairs and circling round the pistil; each pair united below, consisting of a long and a short filament. Anthers arrowed.
Pist. Germ awled, pointed, furrowed, with praminent seedlets, sitting on a glandular pedicel. Style thread-form, longer than the stamens, incurved above them. Stigma simple.
Per.
Flowers verticilled; Corols blue, or bright violet; centre of the under lip yellow. Ferticils, each surrounded by six thorns, very long, diverging, coloured above; under which are the leaves, alike verticilled, lanced, acutely sawed, pubescent, interspersed
interspersed with bristles. Stem jointed, flattish, hairy, reddish; furrowed on both sides; broader at the joints, or above the verticils; furrozis alternate.

## 55. Sindhuca:

Syn Sindhuraira, Indrasurisa, Nirvand今̈, Indránicio Vulg. Nis'andè.
Linn. Three-leaved Vitex, or Negundo?
Cal. Perianth five-toothed, beneath, permanent; toothlets acute, subequal.
Cor One-petaled, grinning; Tube funnel-shaped, internally villous; border two-lipped; upper lip broad, concave, more deeply coloured; under lip four-cleft; divisions acute, similar.
Stam. Filaments four; two shorter, adhering to the Tube, villous at the base. Anthers half-mooned,
Pist. Germ globular; Style thread-form; Stignu? two-parted, pointed, reflex.
Per. Berry (unless it be the coat of a naked seed) roundish, very hard, black, obscurely furrowed, with the callyx closely adhering.
Semes from one to four? I never saw more than one, as Rherde has well described it.
Flowers raceme-panicled; purplish or dark blue without, greyish within, small. Racemes mostly terminal; some pedicels many-flowered.
Stem distinctly four-sided; sides channelled, jointed, bending. Stipules egged, scaly, thickish, close. Branchlets cross armed.
The tube of the corol is covered internally with a tangle of silvery silky down, exquisitely beautiful; more dense below the ufter lip.

This charming shrub, which seems to delight in watery places, rises to the height of ten or twelve, and somerimes of twenty feet; exhibiting a most. elegant appearance, with rich racemes or panicles lightly dispersed on the summit of its branchlets. On a comparison of two engravings in Rumphius, and as many in Van Rheede, and of the descriptions in both works, I am nearly persuaded that the Sindhuca, or Airgaudì, is the Vitex Negundo of LinNews; but it certainly resembles the three-leared Vitex in its leaves, which are opposite, egged, acute, petioled; above mostly three' $d$, below mostly fived; paler beneath; rarely sawed and very slightly, but generally entire: they are very aromatic, and pillows are stuffed with them, to, remove a cold in the head and a head-ach occasioned by it. These, I prusume, are the shrubs which Bowitus calls Lagondi, and which he seems to consider as a panacea.
56. Ca'ratélla:

Syn. Cátillaca, Sushavi.
Vulg. Beng Hurlurijur; Ifiml. Caraila.
Linn, Five-leaved Cleome?
Cal. Periaith four-leaved, gaping at the base, then erect; leaflets egg-oblong; concave, downy, deciduous.
Cor. Cross-form. Petals four expanding, clazars long; folds wrinkled.
Nectary, from six to twelve roundish perforated glands, girding the gibbous secoptacle.

Sram. Filaments six, thread-form, hardly differing in length, inserted on a pedicel below the germ. Anthers erect, pointed, furrowed.
Pist. Germ erect, linear, long, downy, sitting on the produced pedicel. Style very short. Stighe: headed, flat, circular.
Per. Silique one-celled, two-valved, spindle-shaped, with protuberant seeds; crowned with the permanent style.
Seeds very many, roundish, nodding. Receptacles linear, often more than two.
The whole plant, most distinctly one piece. Rocz whitish, with scattered capillary fibres. Stem herbaceous, pale green, in parts purple, hairy, crossarmed, produced into a long raceme crowded at the summit. Branchlets, similar to the stem, leaf-bearing; similar, but smaller leaves rising also from their axils. Leaves fived, roundish-rhomboidal, notched, pointed, hairy, dark green, the lower pairs respectively equal, the odd one much larger, strongly ribbed with processes from the petiol-branchlets, conjoined by the bases of the ribs, in the form of a starlet; each ray whitish and furrowed within. Calyx grcen. Petals white. Anthers covered with gold-coloured pollen. Pedficels purplish. Bracts three'd, similar to the cauline leaves. The sensible qualities of this herb seem to promise great antispasmodic virtues; it has a scent much resembling assafatida, but comparatively delicate and extremely refreshing. For pronouncing this Cleome the Catrace'lla of the ancient Indians, I have only the
authority of Rheene, who has exactly written that word in Mulabar letters. As to his Brahmanical name Tilóni, my vocabularies have nothing more like it than Tilaca, to which Cshurraca and Srimat are the only synonyma.
57. Na'gacésara:

Syn. Chámpéya, Césara; Cánchana, or any other name of gold.
Vulg. Nagasar.
Linn. Iran Mesua.
To the botanical descriptions of this delightful plant, I need only add, that the tree is one of the most beautiful on earth, and that the delicious odour of its blossoms justly gives them a place in the quiver of Ca'madéva. In the poem, called Naishadla, there is a wild but elegant couplet, where the poet compares the white of the Na'gace'sara, from which the bees were scattering the pollen of the numerous gold-coloured anthers, to an alabasterwheel, on which Ca'ma was whetcting his arrows, while sparks of fire were dispersed in every direction. Surely, the gentine appellation of an $I_{n}$ dian plant should be substituted for the corrupted name of a Syrian physician, who could never have feen it: and, if any trivial name were nccessary to distinguish a single species, a more absurd one than irore could not possibly have been selected for a flower with petals like silver and anthers like gold.
58. S'álmali:

Syn. Piclíhila', Pírant, Mücha', Si'hira'yush. Vulg. Semel.

Leñ,

Linn. Seven-leaved Bombax.
59. $\mathrm{S}_{\mathrm{AN}} \mathrm{A}_{\mathrm{A}}$ :

Syn. S'anípushipicá, Ghantíarava.
Vulg. San, pronounced Sun.
Linn. Rushy Crotalaria.
Cal. Perianth one-leaved, villous, permanent; short below, gibbous on both sides, with minute linear tracts. Upper teeth two, lanced, pressing the banner; lower tooth, boat-form, concave, two-gashed in the middle, cohering above and below, sheathing the keel, rather shorter than it; pointed,
Cor. Boat-form.
Banner broad, large, acute, rather hearted, with two dark callosities at the base, and with compressed sides, mostly involving the other parts: a dark line from base to point.
Wings inverse-egg-oblong, with dark callous bodies at their axils, two thirds of the banner in length.
Keel flattened at the point, nearly closed all round to include the fructification; very gibbous below, to receive the germ.
Stam. Filaments ten, coalesced, cleft behind, twoparted below ; alternately short with linear furrowed erect, and long with roundish anthers.
Pist. Germ rather awled, fat, villous, at a right angle with the ascending, cylindric, downy Style. Stigma pubescent, concave, open, somewhat lipped.
PER. Legume pedicelled, short, velvety, turgid, one-celled, two-valved.
Vol. IV
X
SEEDS,

Seeds, from one or two to twelve or more, round-kidney-form, compressed.
Flowers deep yellow. Leaves alternate, lanced, paler beneath, keeled; petioles very short; stipules minute, roundish, villous. Stem striated.
Threads, called pavitraca, from their supposed purity, have been made of Sana from time immemorial: they are mentioned in the laws of Menu.
The retuse-leaved Crotalaria, which Van Rheede, by mistake calls Schama Puspi, is cultivated, I believe, for the same purpose. Rumphius had been truly informed that threads for nets were made from this genus in Bengal; but he suspected the information to be erroneous, and thought that the persons who conveyed it had confounded the Crotalaria with the Capsular Corchorus. Strong ropes and canvas are made of its macerated bark.
The Jangal-s'an, or a variety of the watery CrotalaRIA has very beautiful flowers, with a greenish white banner, purple striped, wings bright violet: stem four-angled and four-winged; leaves egged, obtuse, acute at the base, curled at the edges, downy; stipules two, declining, mooned, if you chuse to call them so, but irregular, and acutely pointed. In all the Indian species, a difference of soil and culture occasion varieties in the flower and fructification.
60, Jayantí
Syn. Jayá, Tercárì, Nàdééz, Vaijayauticá.
Vulg. Jainti Jáhì; some say, Aranì.
Rheede: Kedangu.

Linn. 生schynomene Sesban.
Cal. Perianth one-leaved, rather belled, five-cleft; toothlets awled, erect, sub-equal, more distant on each side of the awning ; permanent.
Cor. Boat-form.
Awoning very broad, rather longer than the wings, inverse-hearted, quite reflected so as to touch the calyx: waved on the margin; furrowed at the base internally, with two converging hornlets fronting the aperture of the keel, gibbous below, awled upwards, acute, erect, within the wings. Wings oblong, clawed, narrower above, obtuse, spurred below, embracing the keel and the hornlets of the awning.
Keel compressed, enclosing the fructification, inflected nearly in a right angle, gashed below and above the flexure; each division hatchet-form; beautifully striated.
Stam. Filaments simple and nine-cleft, inflected like the keel; the simple one curved at the base. Anthers oblong, roundish.
Pist. Germ compressed, linear, erect as high as the flexure of the filaments with visible partitions. Style nearly at a right angle with the germ, awled, inflected like the stamen. Stigma rather headed, somewhat cleft, pellucid.
Per. Legume very long, slender, wreathed when ripe, smooth at the valves, but with seeds ra-

- ther protuberant, many-parted, terminated with a hard sharp point.
Seeds oblong, rather kidney-shaped, smooth, slightly affixed to the suture, solitary.

Stem arborescent, rather knotty. Leaves feathered, pairs from nine to fifteen, or more, often alternate; leaficts oblong, end-nicked, some with an acute point, dark green above, paler beneath, with a gibbosity at the insertion of the petiols; sleeping, or collapsing, towards night. Racemes axillary; pedicels with a double curvature or line of beauty; flowers small, six or seven; varying in colour; in some plants, wholly yellow; in others, with a blackifh-purple awning yellow within, and dark yellow wings tipped with brown; in some with an awning of the richest orange-scarlet externally, and internally of a bright yellow; wings yellow, of different shades; and a keel pale below, with an exquisite changeable light purple above, striated in elegant curves. The whole plant is inexpressibly beautiful, especially in the colour of the buds and leaves, and the grace of all the curves, for there is no proper angle in any part of it. The Bráhmens hold it sacred: Van Rheede says, that they call it Cananga; but I never met with that word in Sanscrit: it has parts like an Hedysarum, and the air of Cytisus.
6i. Pala'sa;
Syn. Cins'uca, Parna, Vátápot'ha.
Vulg. Palas Pla's Dha'c.
Koen. Butea frondosa.
$\mathrm{C}_{\text {Al }}$. Perianth belled, two-lipped upper lip broader, obscurely end-nicked; under lip three-cleft, dow* ny; permanent.
Cor. Boat-form.

Awwing reflected, hearted, downy beneath; sometimes pointed.
Wings lanced, ascending, narrower than the keel.
Keel as long as the wings, two - parted below, halfmooned, ascending.
Stam. Filaments nine and one, ascending, regularly curved. Anthers linear, erect.
Pist. Germ pedicelled, oblongish, downy.
Style awled, about as long as the stamens. Stigma small, minutely cleft.
Per. Legume pedicelled, oblong, compressed, depending.
Seed one, toward the apex of the pericarp flat; smooth, oval-roundish.
Flowers raceme-fascicled, large, red, or French scarlet,

- silvered with down.

Leaves three'd, petioled; leaflets entire, stipuled, large, rhomboïdal ; the lateral ones unequally divided; the terminal one larger, equally bissected, brightly verdant. A perfect description of the arborescent and the twining Pala'sa has been exhibited in the last volume, with a full account of its beautiful red gum ; but the same plant is here shortly described from the life, because few trees are considered by the Hindus as more venerable and holy. The Palása is named with honour in the l'édas, in the laws of Menu, and in Sansorit poems, both sacred and popular; it gave its name to the memorable plain called Pla'ssey by the vulgar, but properly Pala'si; and, on every account, it must be hoped that this noble plant will
retain its ancient and classical appellation. A grove of Palásas was formerly the principal ornament of Crislina-nagar, where we still see the - trunk of an aged tree near six feet in circumference. This genus, ass far as we can judge from written descriptions, seems allied to the Nissolia.
62. Caranjaca;

Syn. Chirabilva, Nactamaila Caraja.
Vulg. Caranja.
Rheede: Caranschi, 6 H. M. tab. 3.
C A L. Perianth one-leaved, cup-form, obscurely five- $^{\text {a }}$ toothed, or scalloped, beaked.
Cor. Boat-form.
Aroning broad, end-nicked, striated, rather spirally inflected, with two callosities at its base.
Wings oblong, of the same length with the awning.
Keel rather shorter, gibbous below, two-parted.
Stam. Filaments nine in one body, gaping at the base, and discovering a ienth close to the style. Anthers
1 egged, erect.
Pisz. Germ above, oblong, downy. Style incurved at the top. Stigma rather headed.
Per. Legume mostly one-seeded, thick, rounded above, flattish, beaked below.
SEED oblong-toundish, rather kidney-form.
Rascemes axillary. Awining pale; wings violet. Leaves feathered with an odd one, mostly two-paired; leaflets egg-oblong, pointed, keeled, short petioled; brownish on one side, pale on the other. Common petiol gibbous at its base. The seed yields an oil supposed to be a cure for the most inveterate scabies.
63. Arjuna:

Syn. Nadisarja, Virataru, Indradru, Cacubba.
Vulg. Jaral.
Rheede. Adamboe; 4 H. M. tab. 20, 21 , 22.
Linn. Beautiful Munchhausia?
Koen. Queein's Flower Lagerstroemia?
Cal. Perianth one-leaved, six-cleft, top-shaped, furrowed, with protuberant ridges, downy, permanent ; divisions coloured, with points reflected.
Cor. Petals six, roundish, somewhat notched, expanding, wavy; claws short, inserted in the calyx.
Stam. Fillaments coloured, numerous, capillary, shortish, obscurely conjoined in six parcels, one to each division of the calyx : Anthers thick, incumbent, roundish, kidney-shaped.
Pist. Germ above, egged. Style coloured, longish, thread-form, incurved. Stigma obtuse.
Per. Capsule egged, six-celled, six-valved.
Seeds numerous.
Panicles racemed, terminal, erect. Flowers violet or light purple, in the highest degree beautiful. Leaves alternate, leathery, 'some opposite, eggoblong, stipuled, most entire, short perioled, smooth, paler beneath. Branches round and smooth. I have seen a single panicle waving near the summit of the tree; covered with blossoms, and as large as a milkmaid's garland. The timber is used for the building of small boats. 64. Vanda':

Syn. Vricshádanì Vricsharuha', Ji'vantica'.
Yulg. Bándà, Persairà, Perasaíà.
These names, like the Linncean, are applicable to all sarasite-plants.

Linn. Retuse-leaved Epidendrum?
Cal. Spathes minute, straggling.
Cor. Petals five, diverging, oval-oblong, obtuse, wavy; the two lowest larger; the three highest equal, bent towards the nectary.
Nectary central, rigid: Mouth gaping, oblique: Upper lip shorter, three-parted, with a polished honey-cup; under lip, concave in the middle, keeled above, with two smaller cavities below, two processes at the base, incurved, hollow, oval-pointed, converging, honey-bearing.
Stam. Filaments very short. Anthers round, flattish, margined, covered with a lid, easily deciduous from the upper lip of the nectary.
Pist. Germ beneath long, ribbed, contorted with curves of opposite flexure. Style very short, adhering to the zipper lip. Stigma simple.
Per. Capsule oblong-conic, wreathed, six-keeled, each with two smaller kecls, three-celled, crowned with the dry corol.
Seeds innumerable, like fine dust, affixed to the Receptacle with extremely fine hairs, which become thick wool.
Scapes incurved, solitary, from the cavity of the leaf, at most seven-flowered; pedicels alternate. $P e_{-}$ tals milk-white externally, transparent; brown within, yellow-spotted. Upper lip of the nectary snow-white; under lip rich purple, or light crimson, striated at the base, with a bright yellow gland, as it seems, on each process. The flowers gratefully fragrant and exquisitely beautiful, looking as if composed of shells, or made of enamel; crisp elastic,
elastic, viscid internally. Leaves sheathing, opposite, equally curved, rather fleshy, sword-form, retuse in two ways at the summit, with one acute point. Roots fibrous, smooth, flexible; shooting even from the top of the leaves. This lovely plant attaches itself chiefly to the highest Amras and Bilvas; but it is an air-plant, and lives in a pot without earth or water: its leaves are excavated upwards, to catch and retain dew. It most resembles the first and second Maravaras of Van Rheede in its roots, leaves, and fruit, but rather differs from them in its inflorescence. Since the parasites are distinguished by the trees on which they most commonly grow, this may in Sanscrit be called Amaravandic; and the name Baculavandia should be applied to the Loranthus; while the Viscum of the oak, I am told, is named Vandà simply and trancendently, the Vindaica, or oak, being held sacred.
65. A'malaci':

Syn. Tishyap'hala' Anritá, Vayast'ha'.
Vulg.
Linn. Phyllanthus Emblicá.
60́. Gajapippalí:
Syn. Caripippali', Capiballi, Colaballi, Sreyas'i, Vas'ira. Some add, Chavica', or Chavya; but that is named in the Amaracósh as a distinct plant, vulgarly Chava, or Chayi.
Vulg. Pippal-j'hanca, Maidah.
Male Flowers.
Cal. Common Perianth-four leaved; leaflets roundish, concave; the two exterior, opposite, smaller, containing
containing from eight to fourteen florets. Partial calya, none.
Cor. None. Nectary, many yellow glands on the pedicel of the filaments.
Stam. Filanents from eight to eighteen in each floret, connected by a short villous pedicel, threadform, very hairy. Aithers large netted, irregular, inflated, containing the pollen.
Pist. Rudiments of a germ and style withering. Fentale Flowers
Cal. Common Perianth as in the male, but smaller; containing from ten to twelve florets.
Partial, calyw none, unless you assume the corol.
Cor. many petaled, belled. Petals erect lancelinear, fleshy, covered within, and externally with white hairs. Nectary, yellow glands sprinkling the receptacle.
Pist. Germ oval. Style cylindric, curved at the base. Stigma headed.
Per. Berry globular, one-seeded.
SEed spherical, smooth.
Flowers umbelled, yellow from their anthers. Leaves mostly oblong-lanced, but remarkahly varying in shape, alternate. Both flowers and fruit have an agreeable scent of lemon-peel; and the berries, as a native gardener informs me, are used as a spice or condiment. It was from him that I learned the Sanscrit name of the plant: but as balli meansa creeper, and as the Pippal-jhanca, is a tree perfectly able to stand without support, I suspect in some degree the accuracy of his information; though I
cannot account for his using a Sanscrit word without being led to it, unless he had acquired at least traditional knowledge. It might be referred, from the imperfect mixed flower, to the twenty-third class. 67. SA'cóta'ca:

Syn.
Vulg. Sy'ura, or Syaura.
Koen. Rough-leaved Tropris?
MALE.
Cal. Common imbricated; leafets six or eight, egged, acute, small, expanding, withering, containing generally from five to seven flowerets. Partial four-parted; divisions egged, expanded, villous.
Cor. None, unless you assume the calyx.
Stam. Filuments mostly four (in some, three; in one, five) awled, fleshy, rather compressed, spreading over the divisions of the calyx, and adhering to them at the point. Anthers double, folded:
The buds elastic, springing open on a touch.

> FEMALE.

Cal. Four-parted; divisions egged, concave, pointed, permanent, propped by two small bracts; unless you call them the calyx.
Cor. None; unless you give the calyx that name.
Pis T. Germ roundish. Style very short, cylindric.
Stigma long, two-parted, permanent.
Per. Berry one-seeded, navelled, smooth, somewhat flattened.
Seed globular, arilled.
Leaves various, some inverse-egged, some oblong,
some oval, pointed, irregularly notched, alternate (some opposite), crowded, crisp, very rough veined, and paler beneath, smoother and dark above. Berry, deep yellow. The Pandits having only observed the male plant, insist that it bears no fruit. Female flowers axillary, from one to four or five in an axil.
68. Virana:

Syn. Viratara.
Vulg. Béná Gaindàr Cata.
Retz. Muricated Andropogon.
Roxb. Aromatic Andropogon.
The root of this useful plant, which $\mathrm{Ca}^{\prime}$ lida's calls us'ira, has nine other names, thus arranged in a' Sanscrit verse : Abhaya, Nalada, Sévya Amrinaila, Jala'sraya, Lámajjaca, Laghulaya, Avada'ha, Ishtacápat'ha.
It will be sufficient to remark, that Ja'las'aya means aquatic, and that Avada'ha implies a power of allaying feverish heat; for which purpose the root was brought by Gautamí to her pupil Sacontalá. The slender fibres of it, which we know here by the name of Chas or Khaskhas, are most agrecably aromatic when tolerably fresh; and, among the innocent luxuries of this climate, we may assign the first rank to the coolness and fragrance which the large hurdles or screens in which they are interwoven, impart to the hottest air, by the means of water dashed through them; while the strong southern wind spreads the scent before it, and the quick evaporation contributes to cool the atmosphere. Having never seen
the fresh plant, I guessed, from the name in Van Rheede and from the thin roots, that it was the $A$ siatic Acorus; but a drawing of Dr. Roxburgh's has convinced me that I was mistaken.
69. S'ami.

Syn. Sacin-phala', S'ivá.
Vulg. Sáën Bábul.
Linn. Farnesian Mimosa.
Thorns double, white, black pointed, stipular. Leaves twice feathered; first, in three or four pairs, then in pairs from fourteen to sixteen. Spikes globular, with short peduncles; yellow, perfuming the woods and roads with a rich aromatic odour. A minute gland on the petiols below the leaflets. Wood extremely hard, ufed by the Bra'hmens to kindle their sacred fire, by rubbing two pieces of it together, when it is of a proper age and sufficiently dried. Gum semi-pellucid. Legumes rather spindle-shaped, but irregular, curved, acutely pointed, or daggered, with twelve' or fourteen seeds rather prominent, gum. my within. Seeds roundish, compressed. The gum of this valuable plant is more transparent than that of the Nilotic or Arabian species; whicin the Arabs call Ummuilghilan, or Mother of Scrpents; and the Persians, by an' easy corruption, Mughilàn.
Samíra means a small Samì; but l cannot lcarn to what species that dimunitive form is applied.
Lajja'ru (properly Lajiálu) signifies bashful, or sensitive, and appears to be the word engraved on a plate in the Malabar Garden; though Van. Rheede pronounces it Lauri. There can be no doubt that it is the sevimming Mimosa, with serzsilive leaves, root inclosed in a spungy cylinder, and flowerets with only ten filaments. Linneus, by a mere slip, has referred to this plant as his Dwarf 不schynomene; which we frequently meet with in India.-See 9 H. M. tab. 20 The epithet Lajjálu is given by the Pandits to the Modest Mimosa.
70. Chandraca:

Syn. Chandrapushpa.
Vulg. Ch'hìta Chiànd, or Moonlet.
Rheede: Sjouanna Amelpodi, 6 H. M. t. 47.
Lini. Serpent Ophioxylum.
Gal. Perianth, five-parted, small, coloured, erect, permanent ; divisions egged, acutish.
Cor. Petal, one. Tube very long in proportion; jointed near the middle, gibbous from the enclosed anthers; above them, rather funnel-form. Border five-parted; diwisions inverse-egged, wreathed
Pist. Germ above, roundish. Style thread.form. Stigma irregularly headed; with a circular pellucid base, or nectary, extremely viscid.
Per. Berry mostly twinned, often single, roundish, smooth, minutely pointed, one-seeded.
Seed on one side flatish, or concave; on the other, convex.
Flowers fascicled. Bracts minute, egged, pointed, coloured. Tube of the corol light purple; border small,
small, milk-white. Calyx first pale pink, then bright cafmine. Petiols narrow-winged. Lerves oblong-oval, pointed, nerved, dark and glossy above, mostly three-fold, sometimes paired, often four-fold near the summit; margins wavy. Few shrubs in the world are more clegant than the Chandra, especially when the vivid carmine of the perianth is contrasted not only with the milk-white corol, but with the rich green berries, which at the same time embellish the fascicle: the mature berries are black, and their pulp light purple. The Bengal peasants assure me, as the natives of Malabar had informed Rheede, that the root of this plant seldom fails to cure animals bitten by snakes, or stung by scorpions; and, if it be the plant, supposed to assist the Nacula, or Viverra Ichneunon, in his battles with serpents, its nime synonyma have been strung together in the following distich :

Na'culí, Surasa', Ra'sna', Suganda' Gandhanáculí' Náculéshta', Bhujanggicshí, Ch'katrica', Su: iha, nava.
The vulgar name, however, of the ichneumonplant is Rásan; and its fourth Surnscrit appellation signifies well-scented; a quality which an ichneumon alone could apply to the Ophioxylum; since it has a strong, and rather feetid odour. The fifth and sixth epithets, indeed, seem to imply that its scent is agreeable to the Nacula; and the seventh (according to the comment on the Amaracosh) that it is offensive to snakes. It is asserted
by some, that the Rísan is no other than the Rough Indian Achyranthes; and by others, that it is one of the Indian Aristólochias. From respect to Linnseus, I leave this genus in his mixed class; but neither my eyes, nor far better eyes than mine, have been able to discover its male flowers; and it must be confessed, that all the descriptions of the Ophioxylum, by Rumphius, Burman, and the great botanist himself, abound with erroneous references, and unaccountable oversights.
71. Pippala:

Syn. Bódhi-druma, Chala-dula, Cunjarásanas, Anzoat'ha.
Vulg. Pippal.
Linn. Holy Ficus: but the three following are also thought holy. Fruit small, round, axillary, sessile, mostly twin. Leaves hearted, scalloped, glossy, daggered; petiols very long; whence it is called chaladala, or the tree with tremulous leares.
72. Udumbara:

Syn. Jantu-p'hala, Yajnyínga, Hémadugdhaca.
Vulg. Dumbar.
Linn. Racemed Ficus.
Fruit peduncled, top-shape, navelled racemed.
Leaves egg - oblong, pointed, some hearted, obscurely sawed, veined, rough above, netted beneath. Van Rheede has changed the Sanscrit name into Roembadoo. It is true, as he says, that minute ants are hatched in the ripe fruit, whence it is named Jantu-plala; and the Pandits compare it to the Mundane Egg.
73. Placsha:

Syn. Fati, Parcatí.
Vulg. Pácari, Pácar.
Linn. Indian Ficus citron-leaved; but all four are Indian.
Iruit sessile, small, mostly twin, crouded, whitish. Leaves oblong, hearted, pointed, with very long slender petiols.
74. Vata:

Syn. Nyagróllba, Babupát.
Vulg. Ber.
Linn. Benual Ficus, but all are found in this province, and none peculiar to it.
Fruit roundish, blood-red, navelled, mostly twin, sessile. Calyx threc-leaved, imbricated.
Leaves some hearted, mostly egged, obtuse, broadish, most entire, petiols thick, short, "branches radicating.
The Sanscrit name is given also to the very large Ficus Indica, with radicating branches, and to some other varictics of that species. Van Rhexde has by mistake transferred the name Aszatt'lba to the Placsba, which is never so called.
75. Caraca:

Syn. Bbauma, Ch'latráca,
Vulc.
Linn. Fungus Agaric.
This and the Pballus are the only fungi, which I have yet seen in India: the ancient Hindus held the fungus in such detestation, that Y'sma, a legislator, supposed now to be the judge of departed spirits, Yol. IV.
declares " those, who eat mushrooms, whether " springing from the ground or growing on a tree, " fully equal in guilt to the slayers of Brábmens, and " the moft despicable of all deadly sinners."
76. TA'la:

Syn. Trinarájan.
Vulg. Tál, Palmeira.
Linn. Borassus.
This Magnificent palm is juftly entitled the king of its order, which the Hindus call trina druma, or grass trees. Van Rheede mentions the bluish gelatinous, pellucid substance of the young seeds, which, in the hot season is cooling, and agreeable to the taste; but the liquor extracted from the tree, is the most seducing and pernicious of intoxicating vegetable juices: when just drawn, it is as pleasant as Poubon water fresh from the spring, and almost equal to the best mild Cbampaigne. From this liquor, according to RHEEDE, sugar is extracted; and it would be happy for these provinces, if it were always applied to so innocent a purpose.
77. Na'rice'la:

Syn. Lángalin.
Vulg. Nárgil, Nárjil. Linn. Nut-bearing Cocos.

Of a palm so well known to Europeans, little more necd be mentioned than the true Afatic name: the water of the young fruit is neither so copious, nor so transparent and refreshing in Bengal, as in the isle of Hinzuan, where the natives, who use the unripe nuts in their cookery, take extreme care of the trees.

Gillul Minar inntpritiogt.
78. Guva'ca:

Syn. Gbónt'bá, Púga, Cramuca, Capura. Vulg. Supyári.
Linn. Areca Catechu.
The trivial name of this beautiful palm having been occasioned by a gross error, it must necessarily be changed; and Guváca should be substituted in its place. The inspissated juice of the Minosa C'badira being vulgarly known by the name of Cat'h, that vulgar name has been changed by Europeans into Catecbu; and because it is chewed with thin slices of the Udvéga, or Areca-nut, a species of this palm has been distinguished by the same ridiculous corruption.

$$

THE base of the Cuttub Minar, is a polygon of twenty-seven sides, and rises upon it in a circular form; the diminution of the column, is in a
good proportion. I do not mean to infer, that the architect has followed any established rule, for it does not appear, that the ancients, in any country, were tied down to rule; for although we see extremely different instances of the diminution in their works, in general they all look well.

The exterior part of the Minar is fluted into twenty-seven semicircular and angular divisions, upon which is written a good deal of a very ancient Arabic character; it is supposed to contain passages from the Koran; there are four balconies in the height of the building, the first is at the height of ninety feet, the second at 140 , the third at 180 , and the fourth at 203 feet; to the height of 180 feet, the pillar is built of an exceeding fine red Granite, and the fluting there ends. The balconies are supported upon large stone brackets, and have had small battlements erected upon them, as a preventive from people who may choose to go into them from falling, and serve likewisc, as an ornamental purpose to the building; from the height of 203 feet, excepting a few inconsiderable ornaments, it rises with an even surface, and circular form, built of very fine white marble; upon which the date when the Minar was completed is said to be written. It was a matter of much disappointment, that I could not approach sufficiently near to the date to copy it; for I found it was situated at such a height, as to put it totally out of my power; and what adds to the difficulty is, that there is not a bamboo, or wood of any kind produced in that part of the country, calculated to raise a scaf. folding with.

As irregular spiral stair-case, leads from the bottom, to the summit of the Minar, which is crowned with a majestic Cupola of red Granite ; there are many openings during the ascent, for the admiffion of light and air; at each balcony, an opening to allow of people walking into them, but I found the battlements in many parts entirely ruined, and those that were standing in such a decayed state, as to render it a matter of some danger to venture out fiom? the stair-case.

The entire height of the Cuttub Minar is 242 feet and six inches: I ascertained it by measuring a direct line from its base; and, as it may be a matter of some satisfaction to see that it is done with precision, I annex the Trigonometrical calculation.

The Base A B being measured in a right line front the bottom of the Mi-C, nar; was found to be 102 feet and six inches; twenty-four feet one inch, the semi-diameter of the Ease of the Mi-
 nar being added to it, B gave a line of 426 feet and seven inches from the centre of the Pillar. At the extremity of the Base $A$, a Theodolite was placed, and previously being carefully adjusted, by putting the line of collimation in the Telescope, parallel to the plane of the Horizon, the angle BAC was obscrved to be twenty-nine degrees, thirty-nine minutes; thence the height of the Cuttub Minar, was found to be 242 feet and neardy six inches.

## By Plane Trigonometry.

The Base A B giving 426 feet, seven inches, say 426,5 , the angle $B A C$ is given $29^{\circ}, 39^{\prime}$, the angle BAC is a right one; the sum of the angles in all triangles being equal to two right angles, or 180 degrees, by deducting the sum of the two angles C A B and $A B C$, from the sum of three angles in the triangle $A B C$, the angle $A C B$ will be found

$$
\begin{aligned}
& \text { С A B }=29.39 \\
& \text { А B C }=90 .
\end{aligned}
$$

$$
180-119.39=60.21=\text { Angle A C B. }
$$

Then as the angle $A C B$ is to the side $A B$, so is the angle $C A B$ to the side $C B$, or height of the Minar.

$$

$$

The Guttub Minar is situated about nine miles bearing S. 16 W . from the Fumma Musjid, that was crected by the Emperor Shaw Jehan in the present city of Delbi, and appears to have been designed for a Minaret to a most stupendous mosque, which never was completed; a considerable part of the second and corresponding Minaret is to be seen, and many other parts of this intended immense building, particularly
cularly of the arches. The mosque seems to have been abandoned in this unfinished state, from causes at this time entirely unknown; perhaps the original designer of the fabrick found human life too short to see it accomplished during his existence. It may not appear a matter of much surprize that the wealth of one man should be found inadequate to so arduous an undertaking, however opulent and exalted in life his situation may have been. The tomb of Cuttub SHAW, at whose expence the Minar is said to have been built, is to be seen a few hundred yards to the westward of it : the tomb is rather inconsiderable and of mean appearance, when compared with the many more magnificent mausoleums that are to be met with in the extensive ruins of Delbi.

Cuttub Shat came to the throne of Delbi in the Mussulnan year 602, corresponding with the Cbristian æra 1205, and died in the Mussulnuan year 607, or Cbristian æra 1210 , a reign of only five years; and certainly a period not sufficient to erect so large a building as a mosque, to correspond in magnitude and grandeur with the Minar and other parts of the structure that were began upon, adjoining to it.

Ithinkit may with some degree of reason be inferred that a stop was put to the building of the mosque at the decease of Cuttub Shaw, and from which period we may date the Minar to have been completed; conformably with this inference, it is ascertained that the Minar has ftood at least 580 years. Excepting the unavoidable and irresistible effects of lightning, from the goodness of the materials, and the
excellent judgment with which they appear to have been put together, there is every reason to suppose it would have withstood the ravages of time, for succceding generations to behold, with admiration and astonishment, for yet many agcs.

# XIX. <br> ASTRONOMICAL OBSERVATIONS MADE ON <br> A VOYAGE <br> TO THE 

ANDAMAN añd NICOBAR ISLANDS,
BY
LIEUT. R. H. COLEBROOKE.

Diamond Island, near Cape Negrais, 1789. December I4th. By the Sun's Meridian $\}$ Latitude. Altitude taken on shore, $-\quad-\quad$ I $5^{\circ} 49^{\prime} 33^{\prime \prime}$ By Captain Kyd, - - $\quad 154943$ Mean I5 $493^{8}$

[^11]342 TABLE OF LATITUDES AND LONGITUDES.
Note by Mr. Burrow.
As a more particular account will be given hereafter of the manner in which these Latitudes and Lorsgitudes were deduced, it will be sufficient here to mention, that the Meridian Altitudes of Stars from whence the Latitudes were derived, sometimes amounted to twenty or thirty, North and South, and very seldorn were less than five or six, and those mostly on both sides the Meridian; so that, upon the whole, I believe very few of the foregoing Latitudes can be more than five seconds wrong, perhaps not many of them so much, as the single observations with the Sextant seldom differed from one another more than fifteen or twenty seconds, and very often not half the number. As to the Longitudes, it is possible there may in some cases be an error of two or three miles; but I can scarce believe there is any great probability of $i t$, as the observations were made, as well as calculated, in a different and more exact manner than is generally used at present.

\text { ON SOME EXTRAORDINARY FACTS } \\
\text { CUSTOMS, AND PRACTICES } \\
\text { OF THE HINDUS. }
\end{gathered}
$$

BY THE PRESIDENT.

1N the preliminary discourse addressed to the Society by our late President, Man and Nature were proposed as the comprehensive objects of our Researches; and although I by no means think that advantage should be taken of this extensive proposition to record every trivial peculiaricy of practice, habit, or thinking, which chasacterizes the natives of India, many singularities will be found amongst them which are equally calculated to gratify curiosity, and to attract the notice of the philosopher and politician.

Of all sudies, that of the human mind is of the greatest importance; and whether we trace it in its perfection or debasement, we learn to avoid errof, or obtain models for improvement and examples for imitation. In pursuing customs and habits to the principles from which they are derived, we ascertain by the sure rule of experience the effects of natural or moral causes upon the human mind.

The characters of the natives of India, notwithstanding all that has been published in Europe, are by no means well understood there; and a careful and

$$

$$

344 ON SOME EXTRAORDINARY FACTS, CUSTOMS,
accurate investigation of them, with a due discrimination of habits and usages, as local or general, would afford a subject for a curious, useful, and entertaining dissertation.

It is not my intention to undertake it. I neither profess to have ability, nor have I leisure for the task; and the preceding remarks are offered to the Society for the purpose only of introducing the recital of some extraordinary facts, customs, and practices of this country, which have occurred to my observation in the course of public duty. If the narrative has too much of the language of office, it may be deem. ed a sufficient compensation that it is extracted from official documents, and judicial records, and hence has a claim to authenticity.

The inviolability of a Brábmer is a fixed principle of the Hindus; and to deprive him of life, either by direct violence, or by causing his death in any mode is a crime which admits of no expiation. To this principle may be traced the practice called Dherna, which was formerly familiar at Benares, and may be translated Caftion or Arrest. It is used by the Brábmens in that city, to gain a point which cannot be accomplished by any other means; and the prom cess is as follows:

The Bratbmen who adopts this expedient for the purpose mentioned, proceeds to the door or house of the person against whom it is directed, or wherever he may most conveniently intercept him: he there sets down in Dherna, with poison, or a poignard, or some other instrument of suicide in his hand, and threatening
threatening to use it if his adversary should attempt to molest or pass him, he thus completely arrests him. In this situation the Brabmen fasts; and by the rigor of the etiquette, which is rarely infringed, the unfortunate object of his arrest ought also to fast; and thus they both remain until the institutor of the Dherna obtains satisfaction. In this, as he seldom makes the attempt without resolution to persevere, he rarely fails; for if the party thus arrested were to suffer the Brábmen sitting in Dberna to perish by hunger, the sin would for ever lie upon his head. This practice has been less frequent of late years, since the institution of the Court of Justice at Benares in 1783 ; but the interference of that Court, and even that of the Resident there, has occasionally proved insufficient to check it ; as it has been deemed in general most prudent to avoid for this purpose the use of coercion, from an apprehension that the first appearance of it might drive the sitter in Dberna to suicide. The discredit of the act would not only fall upon the officers of Justice, but upon the Government itself.

The practice of sitting in Dherna is not confined to male B-ábmens only. The following instance, which happened at Benares in the year 1789 , will at once prove and exemplify it :-

Beenoo bhat the widow of a man of the Brábminical tribe, had a litigation with her brother-in-law Balkisiren, which was tried by arbitration; and the trial and sentence were revised by the court of Justice at Benares, and again in A ppeal.

The suit of Beetioo involved a claim of property and

346 OF SGME FXTRAORDINARY FACTS, CUSTOMS,
a consideration of cast, which her antagonist declared she had forfeited. The decision was favourable to her, but not to the extent of her wishes; and she resolved therefore to procure by the expedient of the Dberna, as above explained, what neither the award of arbitration nor the judicial decision had granted.

In conformity to this resolution, Beenoo sat down in Dberina on Bafkishen; and he, after a perseverance of several days, apprehensive of her death, repaire with her to a Hindu temple in Bcinares: where they both concinued to fast some time longer. Tharteen days had clapsed from the commencement of BaLxisHEN'S arrest, when heyielded the contest, by entering into a conditional agreement with Beenoo, that if she could establish the validity of her cast, and in proof thereof prevail on some creditable members of her own tribe to partake with her of an entertainment of her providing, he would not only gefray the expence of it, but would also discharge her debts: The conditions were accepted by Beenoo, who fulfilled her part of the obligation; and her antagonist, without hesitation, defrayed the charges of the entertainment: but the non-performance of his engagement to discharge her debts, induced Beenoo BHal to institute a suit against him ; and the practice of the Dherna, with the proofs of it, were thus brought forward to official notice.

Ir is not unworthy of remark, that some of the Pamits, on being consulted, admitted the validity of an ohligation extorted by Dherna, provided the objcit were to obtain a just cause, or right wickedly
withheld
withheld by the other party, but not otherwife. Others again rejected the validity of an engagement so extorted, unless it should be subseçuently confirmed by the writer, either in whole or in part, after the removal of the coercion upon him.

Of the practice which I have related, no instance exactly similar has occurred to my knowledge in Bengal or Bebar, although Bräbmens, even in Calcutta, have been known to obtain charity or subsistence from Hindus, by posting themselves before the doors of their houses, under a declaration to remain there until their solicitations were granted. The moderation of the demand generally induces a compliance with it ; which would be withheld if the requisition were excessive. But I have been credibly informed that instances of this custom occasionally occur in some parts of the Vizier's dominions, and that Brábmens have been successfully employed the e to recover claims, by calling upon the debtor to pay them, with a notification that they would fast until the discharge of the debt. The debtor, if he possesses property or credit. never fails to satisfy the demand againft him.

Another practice, of a very singular and cruel nature, is called Erecting a Koor. This term is explained to mean a circular pile of wood which is prepared ready for conflagration. Upon this, sometimes a cow, and sometimes an old woman, is placed by the constructors of the pile; and the whole is confumed together. The object of this practice is to intimidate the officers of Government, or others, from importunate demands, as the effect of the sacrifice is fupposed

348 ON SOME EXTRAORDINARY FACTS, CUSTOMS,
so involve in great sin the person whose conduce forces the constructor of the Koor to this expedient.

A v instance of this practice occurred in a district of the province of Benares in the year 1788. Three Brálinens had erected a Koor, upon which an old woman had suffered herself to be placed; the object of temporary intimidation was fully attained by it, and the timely interposition of authority prevented the completion of the sacrifice. It camnot be uninteresting to know the cause which urged the three Brábmens to this desperate and cruel resource. Their own explanation is summarily this: That they held lands in partnerfhip with others, but that the public assessment was unequally imposed upon them; as their partners paid less, whilst they were charged with more than their due proportion; they therefore refused to discharge any part of the revenues whatever, and erected a Koor to intimidate the government's officers from making any demands upon them. Their sole object, as they explicitly declared, was to obtain an equal distribution of the public assessment between themselves and their pareners.

A woman, nearly blind from age, had in this instance been placed upon the Koor: she was summoned to appear before the Englifh supcrintendent of the province, but absolutely refused to attend him; declaring that she would throw herself into the first well rather than submit. The summons was not enforced.

This is the only instance of setting up a Koor which had occurred for many years, previous to 1788 , although the practice is said to have been frequent for-
merly. No information has reached me of the repezition of this practice in Benares, or of the existence of it in any other part of the Company's poffeffions; nor is it pretended that it was ever general throughout Benares, bat is expressly asserted to have been limited to a very fmall portion of that extensive province.

This last mentioned fact is very opposite to that humanity and mildness of disposition by which the author of the historical disquisition, regarding ancient and modern India, affirms the inhabitants of this country to have been distinguished in every age. As a general position, liable to particular exceptions, I am not authorized to dispute it : but it must at the same time be admitted, that individuals in India are often irritated by petty provocations to the commission of acts which no provocation can justify; and, without reference to the conduct of professed depredators, examples may be produced of enormities scarcely credible: the result of vindictive pride, and ungoverned violence of temper.

In support of these assertions, I shall quote three remarkable instances, attested by unquestionable evidence. In ifg1 Soodishter Mier,a Bráhmen, the farmer of land paying revenue and tenant of tax free land in the province of Benares, was summoned to appear before a native officer, the deputy collector of the district where he resided. He positively refused to obey the fummons, which was repeated without effect; and after some time several people were deputed to enforce the process, by compelling his attendance. On their
$35^{\circ}$ ON SORE EXTRAORDINARY FACTS, CU'STOMS,
approaching his house he cut off the head of his deceased son's widow, and threw it out. His first intention was to destroy his own wife; but it was proved in evidence that, upon his indication of it, his son's widow requested him to decapitate her; which he instantly did.

In this case, the process against Soodishter was regular, his disobedience contemptuous; his situation in life entitled him to no particular exemption, he had nothing to apprehend from obeying the requisition, and he was certain of redress if injury or injustice were practised upon him.

Another Brábmen, named Baloo Paundeh, if 1793, was convicted of the murder of his daughter. His own account of the transaction will best explain it, and his motives; I give it in abstract. That about twelve years before the period of the murder, he, Baloo, and another man, were joint tenants and cultivators of a spot of ground, when his partner $B$ aloo relinquished his share. In 1793 this partner again brought forward a claim to a share in the ground: the claim was referred to arbitration, and a decision was pronounced in favour of Baloo. He consequently repaired to the land, and was ploughing it, when he was interrupted by his opponent. The words of Baloo are as follows: " I became angry, and en"raged at his forbidding me, and bringing my own " little daughter Apaunya, who was only a year and " a half old, to the said field, I killed her with my "sword." This transaction also happened in the province of Bunurcs.

The

The last instance is an act of matricide, perpetrated by Beechue and Adher, two Byábinche, and zemindars, or proprietors of landed estates, the extent of which did not exceed eight acres. The village in which they resided was the property of many other zemindars. A dispute, which originated in a competition for the general fuperintendence of the revenues of the village, had long subsisted between the two brothers and a perfon named Gowry; and the officer of government, who had conferred this charge upon the latter, was intimidated into a revocation of it by the threats of the mother of Beechux and Adier to swallow poison, as well as to the transfer of the management to the two Brabmeris. By the same means of intimidation he was deterred from investigating the complaints of Gowry, which had been referred to his enquiry by his superior authority.

But the immediate cause which instigated the Brábmens to murder their mother, was an act of violence, said to have been committed by the emissaries of Gowry, with or without his zuthority; and employed by him for a different purpose, in entering their house, during their absence at night, and carrying off forty rupees, the property of Beechuk and Adher, from the apartments of their women.

Beechuk first returned to his house, where his mother, his wife, and his sister-in-law, related what had happened. He immediately conducted his mother to an adjacent rivulct, where, being joined in the

## 352 ON SOME EXTRAORDINARY FACTS, CUSTOMS,

grey of the morning by his brother ADHER, they called out aloud to the people of the village, that although they would overlook the assault as an act which could not be remedied, the forty rupees muse be returned. To this exclamation no answer was received; nor is there any certainty that it was even heard by any person; and Bexchuk without further hesitation drew his scymetar, and at one stroke severed his mother's head from her body, with the professed view, as entertained and avowed both by parent and son, that the mother's spirit, excited by the beating of a large drum during forty days, might for ever haunt, torment, and pursue to death Gowry and the others concerned with him. The last words which the mother pronounced were, that she would blast the said Gowry and those connected with him.

Theviolence asserted to have been committed by the emissaries of Gowry, in forcibly entering the female apartments of BEECHUK and $A D H E R$, might be deemed an indignity of high provocation; but they appear to have considered this outrage as of less importance than the loss of their money, which might and would have been recovered with due satisfaction, by application to the Court of Justice in Benares. The act which they perpetrated had no other sanction than what was derived from the local prejudices of the place where they resided: it was a crime against their religion : and the two brothers themselves quoted an instance of a Braibmen, who six or seven years before had lose his cast and all intercourse with the other Brathores, for an act of the same nature. But in truth
truth Beectur and Adier, although Brábmens, had no knowledge or education suitable to the high distinction of their cast; of which they preserved the pride only ; being as grossly ignorant and prejudiced as the meanest peasants in any part of the world. They seemed surprized when they heard the doom of forfeiture of cast pronounced against them by a learned Pandit; and openly avowed that, so far from conceiving they had committed a barbarous crime, both they and their mother considered their act as a vindication of their honour, not liable to any religious penalty.

The Society will observe, with some surprize, that the perpetrators of the several acts which I have related, were Brábinens. These facts took place within three districts only of the province of Benares, named Kuntel, Buddhoose, and Kereat Sekur. I mention these particulars that I may not lead any person into a common error of deducing general conclufions from partial circumstances. In Bengal ánd Bebar, where the passions of jealousy, pride, and revenge, sometimes produce very fatal consequences, I recollect no instance where the efforts of their violence have been transferred from the objects which excited it to others that were innocent, as in the preceding cases.

That the practice of Infanticide fhould ever be so general as to become a custom with any sect or race of people, requires the most unexceptionable evidence to gain belief: and I am sorry to say that the general practice, as far as regards female infants, Vol. IV.

A a
is

354 ON SOME EXTRAORDINARY FACTS, CUSTOMS,
is fully substantiated with respect to a particular tribe on the frontiers of Fuanpore: a district of the province of Benares, adjoining to the country of Oudi. A race of Hindus called Rajekoomars refide here; and it was discovered in 1789 only, that the custom of putting to death their female offspring, by causing the mothers to starve them, had long subsisted, and did actually then very generally prevail amongst them. The resident at Benares, in a circuit which he made through the country where the Rajekoomars dwell, had an opportunity of authenticating the exist-ence of the custom from their own confessions: he conversed with several: all unequivocally admitted it, but all did not fully acknowledge its atrocity; and the only reason which they assigned for the inhuman practice, was the great expence of procuring suitable matches for their daughters, if they allowed them to grow up. It is some satisfaction to add, that the custom, though general, was not universal, as natural affection, or some other motive, had induced the fathers of some Rajeckoomar families to bring up one, or more, of their female issue; but the instances where more than one daughter had been spared, were very rare. One village only furnished a complete exception to the general custom; and the Rajekoomar informant, who noticed it, supposed that the inhabitants had sworn, or solemnly pledged themselves to each other, to bring up their females. In proof of his assertion in favour of the village in question, he added, that several old maids of the Rajeekoomar tribe then actually existed there, and that their celibacy
proceeded
proceeded from the difficulty of procuring husbands for them, in consequence of the great expences atattending the marriages of this class of people.

It will naturally occur to the Society to ask, by What mode a race of men could be continued under the existence of the horrid custom which 1 have described. To this my documents enable me to reply, partly from the exceptions to the general custom, which were occasionally admitted by the more wealthy Rajekoomars; more particularly those who happened to have no male issue ; but chiefly by intermarriages with other Rajepoot families, to which the Rajecoomars were compelled by necessity.

A prohibition enforced by the denunciation of the severest temporal penalties, would have little efficacy in abolishing a custom which existed in opposition to the feelings of humanity and natural affection; and the sanction of that religion which the Rajekoonnars professed was appealed to, in aid of the ordinances of civil authority. Upon this principle an engagement, binding themselves to desist in future from the barbarous practice of causing the death of their female children, was prepared, and circulated amongst the Rajekoomars for their signature; and as it was also discovered that the same custom prevailed, though in a less degree, amongst a smaller tribe of people also, within the province of Benares, called Rajebinses, measures were adopted at the same time, to make them sensible of its iniquity, and to procure from them a subscription similar to that exacted from the Rajekoomars.

356 ON SOME EXTRAORDINARY FACTS, CUSTOMS,
The following is a copy of the engagement which the latter subscribed :-
"Whereas it hath become known to the Go" vernment of the Honourable East India Company, "that we of the tribe of Rajekoomars do not suffer " our female children to live; and whereas this is a "great'crime, as mentioned in the Breloma Bywant " Pooran, where it is said that killing even a Fetus " is as criminal as killing a Brábmen'; and that for " killing a female, or woman, the punishment is to " suffer in the nerk, or hell, called Kat Shootul, for " as many years as there are hairs on their female's " body, and that afterwards that person shall be born " again, and successively become a leper, and be " afflicted with the Fukbima; and whereas the British " Government in India, whose subjects we are, have " an utter detestation of such murderous practices, " and we do ourselves acknowledge, that although " customary among us, they are highly sinful, we "do therefore hereby agree not to commit any longer " such detestable acts; and any among us (which God " forbid) who shall be hereafter guilty thereof, or " shall not bring up and get our daughters married, " to the best of our abilities, among those of our cast, "shall be expelled from our tribe, and shall neither " eat nor kecp society with us, besides suffering " hereafter the punishments denounced in the above "Pooran and Sbaster. We have therefore entered " into this agreement.
"Dated the 17th December, ! 789 ."

Arecord of the various superstitious ceremonies which prevail throughout Hindustan, would form a large and curious volume; but as all the preceding instances which I have related, are taken from transactions in Banares, I cannot refrain from mentioning the superstitious notions of the people of that province regarding the sugar-cane: which proves an ignorance that may be admitted in palliation of grosser errors. The narrative is a mere extract from an official record, with an omission of some words, and some trifing verbal alterations.

As it is usual with the ryots, or husbandmen, to reserve a certain portion of the canes of the preceding year to serve as plants for their new cultivation, it very frequently happens that inconsiderable portions of the old cane remain unappropriated. Whenever this happens, the proprietor repairs to the spot on the ${ }^{2} 5$ th of $\mathfrak{F}$ eyte, or about the IIth of $\mathcal{F} u n$, and having sacrificed to Nagbele, or the tutelary deity of the cane, he immediately sets fire to the whole, and is exceedingly careful to have this operation executed in as complete and efficacious a manner as possible.

This act is performed from an apprehension, that if the old canes were allowed to remain in the ground beyond the 25 th of Feyte, they would in all probability produce flowers and seeds; and the appearance of these flowers thcy consider as one of the greatest misfortunes that can befal them.

They unanimously assert, that if the proprietor of a plantation ever happens to view even a single cane therein in flower after the 25 th of Feyte, the greatest
calamities

358 ON SOME EXTRAORDINARY FACTS, CUSTOMS,
calamities will befal himself, his parents, his children, and his property; in short, that death will sweep away most of the members, or indeed the whole of his family, within a short period after this unfortunate spectacle. If the proprictor's servant happens to see the flower, and immediately pulls it from the stalk, buries it in the earth, and never reveals the circumstance to his master ; in this case they believe that it will not be productive of any evil consequence. But should the matter reach the proprietor's knowledge, the calamities before stated must, according to the prevailing ideas, infallibly happen.

In support of this belief, many of the most aged zemindars and ryots in the province of Benares, recited several instances of the above nature, which they affirmed to have actually happened during their own time; and moreover, that they had been personal witnesses to the evils and misfortunes which befel the unhappy victims of the description alluded to.

When we reflect how generally credit was given to the power of witchcraft, long after the revival of letters in Europe, and that names of great repute for: learning and abilities are found amongst its defeinders', we shall not be surprized that charms and amulets are worn in this country by men of superior rank and education ; that astrologers are consulted to name the fortunate hour for commencing a journey or expedition; and that the fascinating influence of an evil eye upon the human constitution, as well as the power of witchcraft, is admitted by the vulgar in general. Fortunately, however, the practice is not sup-
posed to bear any proportion to the belief of the power; although two recent instances occur to my recollection, of individuals having been sacrificed to this popular delusion ; or at least the imputation of witchcraft was made the pretence for depriving them. of life.

But the judicial records contain a case of great enormity, in which five women were put to death for the fupposed practice of sorcery. I shall submit the circumstances of this transaction, with some detail, before the Society, premising that it happened in a district of Rangyr, the least civilized part of the Company's possessions, amongst a wild and unlettered tribe, denominated Soontaar, who have reduced the detection and trial of perfons suspected of witchcraft to a system.

Three men of the cast of Soontaar, were in the yeat 2792 indicted for the murder of five women; the prisoners without hesitation confessed the crime with which they were charged, and pleaded in their defence that with their tribes it was the immemorial custom and practice to try perfons notorious for witchcraft. That for this purpose an assembly was convened of those of the same tribe, from far and near, and if after due investigation the charge was proved, the sorcerers were put to death, and no complaint was ever preferred on this account to the ruling power. That the women who were killed had undergone the prescribed form of trial, were duly convicted of caufing the death of the son of one of the prisoners by witchA $34 \quad$ craft $_{3}$

360 ON SOME EXTRAORDINARY FACTS, CUSTOMS,
craft, and had been put to death by the prisoners, in conformity to the sentence of the assembly.

The prosecutors, who, agreeably to the forms of the Mabommedan law, were the relations of the deceased women, declared they had no charge to prefer against the prisoners, being satisfied that their relations had really practised sorcery.

The custom pleaded by the prisoners was fully substantiated by the testimony of a great number of witnesses, who recited specific facts in support of it, without any denial or disagreement; and from the collective evidence exhibited in the course of the enquiry, the following curious and extraordinary circumstances appeared:-

That the successive demise of three or four young people in a village, led to a suspicion of sorcery as the cause of it; and the inhabitants taking alarm were upon the watch to detect the witches. They were generally discovered dancing naked at midnight by the light of a lamp, with a broom tied round their waists, either near the house of a sick perfon, or on the outside of the village.

To ascertain with a greater degree of certainty the persons guilty of practising witchcraft, the three following modes are adopted:

First. Branches of the Saul tree, marked with the names of all the females in the village, whether married or unmarried, who have attained the age of twelve years, are planted in the water in the morning, for the space of four hours and a half; and the withering of any of these branches is proof of witcheraft against the person whose name is annexed to it.

Secondly: Small portions of rice enveloped in cloths, marked as abuve, are placed in a nest of white ants; the consumption of the rice in any of the bags, establishes sorcery against the woman whose name it bears.

Thirdly. Lamps are lighted at night; water is placed in cups made of leaves, and mustard-seed and oil is poured, drop by drop, into the water, whilst the name of each woman in the village is pronounced; the appearance of the shadow of any woman on the water, during this ceremony, proves her a witch.

Such are the general rulcs for ascertaining those who practise witchcraft. In the instance which I have quoted, the witnesses swore, and probably believed, that all the proofs against the unfortunate women had been duly verified: they assert in evidence, that the branches marked with the names of the five women accused were withered; that the rice in the bags having their specific names, was devoured by the white ants, whilst that in the other bays remained untouched; that their shadows appeared on the water, on the oil being poured upon it whilst their names were pronounced; and farther, that they were seen dancing at midnight in the situation above described.

It is difficult to conceive that this coincidence of proof could have been made plausible to the grossest ignorance, if experience did not shew that prepossession will supercede the evidence of the senses.

The following custom would be too trivial for notice, if it were not strongly descriptive of the sim-
plicity
$3^{62}$ ON SOME EXTRAORDINARY FACTS, CUSTONS,
plicity and ignorance which mark the character of the gencrality of the inhabitants of Ramgur.

From habitual neglect in ascertaining the quantities of land held in lease, and in defining with accuracy their respective tenures, frequent disputes arise between the inhabitants of different villages regrarding their boundaries: to determine them, a reference is usually made to one or more of the oldest inhabitants of the adjacent villages; and if these should not agree in their decision, other men are selected from the inhabitants of the villages claiming the disputed ground; and the trial procceds as folfows: Holes are dug in the contested spot, and into these holes each of the chosen men puts a leg, and the earh is then thrown in upon it ; and in this situation they remain until one either expresses a wish to be released, or complains of being bitten or stung by some insect. This decides the contest, and the property of the ground is adjudged to belong to that village the inhabitant of which goes through the trial with the most fortitude, and escapes unhurt by insects.

If the preceding detail has no relation to science, it is at least descriptive of mammers; and in availing myself of the opportunities afforded by official occupations (which is all indeed that these occupations admit to contribute my portion to the researches of the Society, my example will, I hope, be imitated by those who with the same, or greater opportunities, possess more knowledge, ability, and leisure.

## NOTE.

Hayinglately received some further documents on the subject of the Dburma, which I did not possess when the preceding paper was read to the Society, I have extracted from them what appears to me requisite to clucidate this extraordinary practice. From these documents it appears that several cases of Dhur Iria had been brought before the Provincial Court of Juftice at Benares, and as a penalty had been annexed to the performance of this mode of importunity, it became necessary to define with precision the rules constituting Dburna, according to the Shaster and Usage.

For this purpose a question was proposed to several Pandits, inhabitants of the province and city of Benares; and the answer subscribed by twenty-three Pandits is as follows:
"Any one who fits Dburna on another's door, or in his house for the realization of a debt, or for other purpose, in which the party sitting takes with him some weapon or poison, and sits down; nor does he eat himself, nor allow the party against whom he is sitting, or his family, to eat; nor does he allow any person ingress into that person's house nor egress from it, and aduressing himself in terms of the strongest oaths to the people of the house, he says, "If any of " those of your house shall eat victuals, or go into your " house, or go out of it, I shall either wound myself "with this weapon, or swallow this poison;" and it does sometimes happen that both these events take place, and that he who sits in Dhwmat is not to remove

346 UN SOME EXTRAORDINARY FACTS, CUSTOMS, SC.
from it without the intreaty of those on whom he is sitting, or the order of the Hakim. Whenever all the requisites above mentioned are found united, they constitute Dburna; but if any one of them be wanting, that is not Dburna, but Tuckaza or Dunning: and as no text of the Shaster hath been found concerning Dluma, wherefore we have delivered the requisites thereof according to the common custom and practice."

There is some difference in the opinions of other Pandits as to what is understood to constitute Dhur$n a$; but the quotation which I have inserted, appears :o me to contain the most authentic information on this subject.

The Society will observe that the practice is not specifically pointed out in the Shaster, but has the sanction of usage only.

The following instance is of late occurrence. In fanuary 1794, Mohun Panreh, an inhabitant of a district in the province of Benares, sat down in Dburna before the house of some Rajepoots, for the purpose of obtaining the payment of Birt, or a charitable subsistence to which he had a claim, and in this situation destroyed himself by swallowing poison. Some of the relations of the deceased retained his corpse for two days before the house of the Rajepoots; who thus were compelled to forgo taking sustenance, in order to induce them to settle the Birt on the heir of the deccased Brábmen.

XXII.

> DESCRIPTION OF THE YAK OF TARTARY, CALLED SOORA-GOK, OR THE BUSHY-TALLED BULL OF TIBET. By Lieutcnant Samuel Turner.

THE Yak of Tartary, called Sooray-Goy in Hinw doftan, and which I term the bushy-tailed bull of Tibet, is about the height of an Englijh bull, which he resembles in the figure of the body, head, and legs. I could discover between them no essential difference, except only, that the $2 \ddot{a} k$ is covered all over with a thick coat of long hair. The head is rather short, crowned with two smooth round horns, that, tapering from the setting-on, terminate in sharp points, arch inwardly; and near the extremities are a little turned back; the ears are small; the forehead appears prominent, being adorned with much curling hair; the eyes are full and large; the nose smooth and convex ; the nostrils small ; the neck short, describing a curvature nearly equal both above and below ; the withers high and arched; the rump low. Over the shoulders riseș a bunch, which at first sight would seem to be the same kind of exuberance peculiar to the cattle of Hindostan; but in reality it consists in the superior length of the hair only, which as well as that along the ridge of the back to the setting-on of the tail, grows long and erect, but not harsh. The tail is composed of a prodigious quantity of long flowing glossy hair descending to the hock, and is so extremely well furnished, that
not a joint of it is perceptible; but it has much the appearance of a large bunch of hair artificially set on. The shoulders, rump, and upper part of the body is clothed with a sort of thick soft wool, but the inferior parts with straight pendant hair, that descends be-low the knee ; and I have seen it so long in some cattle which were in high health and condition, as to trail upon the ground. From the chest, between the forelegs, issues a large pointed tuft of hair, growing somewhat longer than the rest. The legs are very short. In every other respect, hoofs, $\& x$. he resembles the ordinary bull. There is a great variety of colors amongst them, but black or white are the most prevalent. It is not uncommon to see the long hair upon the ridge of the back, the tail, tuft upon the chest, and the legs below the knee white, when all the rest of the animal is jet black.

Tuese cattic, though not large boned, from the profuse quantity of hair with which they are provided, appear of grear bulk. They have a down heavy look, but are fierce, and discover much impatience at the near approach of strangers. They do not low loud (like the cattle of England) any more than those of Hindosten; but make a low grunting noise scarcely audible, and that but seldom, when under some impression of uncasiness. These cattle are pastured in the coldest parts of Tibct, upon the short herbage peculiar to the tops of mountains and bleak plains. That chain of lofty mountains situated between lat. 27 and 8, which divide Tibet from Bootan, and whofe summits are most commonly clothed with snow, is their
favourite
favourite haunt. In this vicinity the southern glens afford them food and shelter during the severity of winter ; in milder seasons the northern aspeit is more congenial to their nature, and admits a wider range. They are a very valuable property to the tribes of illiterate Tartars, who live in tents and tend them from place to place, affording their herdsmen a mode of conveyance, a good covering, and subsistence. They are never employed in agriculture, but are extremely useful as beasts of burthen; for they are strong, sure footed, and carry a great weight. Tents and ropes are manufactured of their hair; and I have, though amongst the humblest rank of herdsmen, seen caps and jackets worn of theirskin. Theirtails are esteemed throughout the East, as far as luxury or parade have any influence on the manners of the people; and on the continent of India are found, under the denomination of Cbowreres, in the hands of the meancst. grooms as well as occasionally in those of the first ministers of state. Yet the best requital with which the carc of their keepers is at length rewarded for selecting; them good pastures, is in the abundant quantity of rich milk they give, yielding most excellent butter, which they have a custom of depositing in skins or bladders, and excluding the air: it keeps in this cold climate during all the year ; so that after some time tending their flocks, when a sufficient stock is accumulated, it remains only toload their cattle and drive them to a proper market with their own produce, which constitutes, to the utmost verge of Tartary, a most material anticle of merchandize.
XXIV.

# - A DESCRIPTION OF THE JONESIA. 

> By Doctor Roxburgh.

## Cl. Heptandria Monogynia。

ESSENTIAI. CHARACTER.

CALYX, two-leaved, Corol, one-petaled, Pistil.. bearing; base of the Tube impervious ; Stamens long, ascending, inserted into the margin of a glandulous necharial ring, which crowns the moutiz of the tube; the uppermost two of which more dis-tant; Style declining. Legume turgid.

Consecrated to the remembrance of our late President, the most justly celebrated Sir William Jones; whose great knowledge of this science, independent of his other incomparable qualifications, justly entitles his memory to this mark of regard.

Jonesia As'óca.
Asjogam. Hort. Mat. 5, P. $11 \%$, Tab. 59.
As o'c $A$, is the Sanscrit name.
Vanjula, a synonime.
Russuk of the Bengalese.
Found in gardens about Calculta, where it grows to be a very handsome middling sized ramous tree; flowering time the beginning of the hot season; Seeds ripen during the rains. The plants and seeds were, I am informed, originally brought from the interior parts of the country, where it is indigenous.

## A DESCRIPTION OF THE JONESIA.

Trunk erect, though not very straight. Bark dark brown, pretty smooth. Branches numerous, spreading in every direction, so as to form a most elegant shady head.
Laeves alternate, abruptly feathered, sessile, generally more than a foot long; when young pendulous and coloured.
Leaflets opposite, from four to six pair, the lowermost broad lanced, the upper lanced; smooth, shining, firm, a little waved, from four to eight inches long.
Petiole common, round and smooth.
Stipule axillary, solitary ;-in fact a process from the base of the common petiole, as in many of the grasses and monandrists, \&c.
Umbels terminal and axilläry; between the stipule and branchlet, globular, crowded, subsessile, erect.
Bracts, a small hearted one under each divison of the umbel.
penuncle and pedicels smooth, coloured.
Flowers very numerous, pretty large; when they first expand, they are of a bcautiful orange colour, gradually changing to red, forming a varicty of lovely shades; fragrant during the night.
Calix perianth, below two-leaved, leaflets small, nearly opposte, coloured, hearted, bracte-like, marking the termination of the pedicel, or beginning of the tube of the corol.
Corol one-petal'd, funnel-form; tube slightly incurved, firm and fleshy, tapering towards the
Vol. IV. Bb base
base (club-funnel-shaped) and there impervious; border four-parted; divison spreading, suborbicular; margins most slightly woolly: one-third the length of the tube.
Nectary a stimeniferous and pistiliferous ring crowns the mouth of the tube.
Stamens, filaments (generally) seven, and seven must, I think, be the natural number; viz. three on each side, and one below, above a vacancy, as if the place of an eight filament, and is occupied on its inside by the pistil; they are equal, distinct, ascending, from three to four times longer than the border of the corol.
Anthers uniform, small, incumbent.
Pistil, germ oblong, pediceled; pedicel inserted into the inside of the nectary, immediately below the vacant space already mentioned; Style nearly as long as the stamens, declining; Stigma simple.
Pericarp, legume scimitar-form, turgid, outside reticulated, otherwise pretty smooth, from six to ten inches long, and about two broad.
Seeds generally from four to eight, smooth; grey, size of a large chesnut.

Note. Many of the flowers have only the rudiment of a pistil: a section of one of these is seen at $D$.

## REFERENGES.

A. A branchlet natural size.
B. A single flower a little magnified, aa the calyn.
C. A section of the same, exbibiting four of the stamens, 1.1.1.x. the pistil 2, and bow far the tube is perforated.
D. A similar section of one of the abortive flowers; 3 is the abortive fistil.
E. The ripe legume opening near the base, natural size. Note, the space between the b and c marks the original tube of the coral.
F. One of the seeds natural size.
G. The base of the common petiole, with its stipule; aa the petioles of the lower pair of leaflets.
LATITUDES OBSERVED.

XXVI.

# A. DISSERTATION ON SEMIRAMIS, 

THE ORIGIN OF MECCA, E'c.

From the Hindu Sacred Books.

BY LIEUT. FRANCIS WILFORD.

IN the Scánda-purána and Vis'va-sára pracása, or declaration of what is most excellent in the world, we find the following legends, which have an evident relation to the origin of Semiramis, the Syrian dove, Ninus, and the building of Ninireh, Hierapolis, and Mecce, \&c.

Maha'-de'va and his consort Pa'rvati, with a view to do good to mankind, quitted their divine abode on Cailasa, and proceeding towards the north, alighted on the summit of the Nisbáda mountains; where they found the Devátas ready to receive them, with a numerous retinue of Celestial Nymphs, and Heavenly Quiristers. MAHA'-DE'va was so struck with the beauty of some of the Apsaras, and his looks were so expressive of his internal raptures, that Pa'rvati, unable to conceal her indignation, uttered the most virulent reproaches againft him. Conscious of the impropriety of his behaviour, MAHA'Ij ${ }^{\prime}$ 'va used every endeavour to pacify her; he humbled himself; he praised her, and addressed her by
the flattering appellation of Maна'-вна'GA; but to no pu pose. She fled into Cusba-duíp, on the mountains of Vabri-vyápta, and seating herself in the hollow trunk of a Samiztree, performed Tapasyá, (or austere devotion) for the space of nine years; when fire springing from her, pervaded with rapid violence the whole range of mountains, in so much, that men and animals were terrified, and fled with the utmost precipitation. De'vi, unwilling that her devotion should prove a cause of distress to the animal creation, recalled the sacred flame, and confined it in the Sami-tree. She made the hollow of that tree her place of abode and dalliance; and hence she is called Sami-Ra'mi', or she who dallies in the Sami-tree.

The fugitives returning, performed the Puja in adoration of her, with songs in her praise. The flame confined in the Sami-tree still remains in it; and the Devátás are highly delighted with the fire, which is lighted from the Aranz (or cubic wood of that tree.) The Arani is the mother of fire, and is produced from the Sami-tree. From that time, this sacred tree gives an increase of virtue, and bestows wealth and corn. In the month of $A s^{\prime}$ wina, or Cooar, the tenth of the first fifteen days of the moon is kept holy, and Pujà is made to Sami-Ra'ma' and to the Sami-tree; and those who perform it obtain the object of their desires. This sacred rite I have hitherto kept concealed from the world, says Maha'de'va, but now I make it known for the good of mankind; and whosocver performs it will be victorious over his enemies for the space of one year.

During

Duringthesetransactions, Vi'sve'swaga-Mahal D $E^{\prime}$ VA, or CA'sípati (that is to say, MAHA'-DE'VA, the lord of the world and sovereign of Cás'i or Benares) visited the country of Purushotama, in Utiola-désa or Oriffa; which he was surprized to find overspread with long grass, and without inhabitants. He resolved to destroy the long grass, and for this purpose, assuming the diminutive shape of a dove, witl an angry countenance, commenced the performance Tapasyà ; his consort $\mathrm{De}_{\mathrm{E}^{\prime} v I^{\prime}}$ also transformed herself into a bird of the same species; and from that time they were known to mankind, and worshipped under the titles of Capo'te'swara and Capo'te'si or Iswara and Isi', in the shape of a dove. They set fire to the Cusbil, or long grass, and the country became like Vindra-vian near (Mutlra) and was soon filled with inhahitants. The spot where they performed their Tapasyà, is called to this day Capóta-st'hali, or the place of the dove. It is a celebrated place of worship, and, as I am informed, about five coss from Yagantát'ha.

Amost the whole universe was likewise at this time overspread with long grass; and to destroy it, Maha' $\mathrm{DE}^{\prime} \mathrm{V}$, , with his consort, resolved to travei round the world. They accordingly proceeded into Cusba-duzs, which they found thinly inhabited by a few Mlecb'bas, or impure tribes, and the Yavanas, who concealed their booty in the grass which covered the country.

Maha'-De'va took compassion on them, and considering their sufferings in this inhospitable country as a sort of Tapasyá, he resolved to bestow Mócsha,
or eternal bliss, on them: for this purposehe assumed the character and countenance of Mo'csife'swara or Iswara, who bestows Mócsha; and directed his consort Capo'te'si, who is also called Mabá-bbága, to go to Vabni-st'bín, on the borders of Cusba-duipa; there to make Tapasyà, in order to destroy the long grass. Accordingly she went into Vabni-st'bán; and that she might effect it without trouble to herself, she assumed another form: from which circumstance she was named Ana'ya'sa'. In this character she seated herself on a beautiful hill, and there made Tapasyà for many days. At last fire sprung from her devotion, and its presiding power standing before her, she directed him to destroy the Cusba; when the hills were soon in a blaze, and the Yavanas and other Mlécb'bas obtaining Mócsioa, were reunited to the Supreme Being, without labour or effect on their part ; that is to say, they were involved in the general conflagration and destroyed.

When the grass was consumed, Ana'ya'sa ordered the clouds to gather and pour their waters on the land, which was snon overflowed. The waters then retired, and the four great tribes came into Cusba-duip, where they soon formed a powerful nation, and became rich and happy. After the conflagration, all sorts of metals and precious stones were found throughont the country. The countenance of $A_{N A} A_{A} A^{\prime} S A^{\prime}-D E^{\prime} V I$ is that of fire ; and a most divine form it is.

The inhabitants soon after deviating from the paths of rectitude, became like the Mlécb'bas: and the Yavanas re-entered Cusba-duip, plundering and laying waste the whole country. The four tribes applied to

ANA'YA'sA', offered praises to her, and requested she would protect them against the Yavanas, and dwell among them. Maha'-bнa'ga' assented, and the spot which she chose for her abode, is called Mahá-bhágást' bán, or the place of Maha' - bha'ga'.
In the mean time Mara' - de'vawas at Mócsha-sl'bán, or Mócsbésa, bestowing Mócsba on all who came to worship there. It is a most holy place; and there Malla' - de'valaid aside the countenance and shape of Capote'siwara, and assumed that of Mocoshe'wara.

Among the first votaties of Maha' $\mathrm{DE}^{\prime} \mathrm{VA}$, who repaired to Mócsba-sy'hán, was $\mathrm{VI}^{\prime}$ rase'n $A$, the son of Guhyaca. He had been making Tapayà for a long time, in honour of Maha'- De'va, who at last appeared to him, and made him king over Sháraras, or the immoveable part of the creation. Hence he was called St'ha'varampati; and the hills, tuces, plants, and grasses of every kind were ordered to obey him. His native country was near the sea; and he began his reign with repressing the wicked, and insisting on all his subjects walking in the paths of justice and rectitude. In order to make his sovereign acknowledged throughout the world, he put himself at the head of a numerous army ; and directing his courfe towards the north, he arrived at Mócsba-st'bán, where he performed the Pujà in honour of Mo'cshe'swara, according to the rites prescribed in the sacred books. From Mócsbésa he advanced towards the Agni-párealas, or firemountains, in Valonist ban ; but they refused to mect him with presents, and to pay tribute to him. Incensed at their insolence, St'has var-pati resolved to de-
strof
stroy them ; the officers on the part of SAMI'-RA'MA', the sovereign of $V$ abnist $t^{b}$ ban, assembled all their troops, and met the army of $\mathrm{St}^{\prime} \mathrm{Han}^{\prime} \mathrm{Var-pati}$; but after a bloody conflict, they were put to flight.
Sami'-Ra'ma' amazed, enquired who this new conqueror was; and soon reflected that he could never have prevailed against her, without a boon from MaHA' $\mathrm{DE}^{\prime} V \mathrm{VA}$, obtained by the means of what is called Ugra-Tapasyá, or a Tapasyá performed with fervor, earnestness of desire, and anger. She had a conference with St'ha'var-pati; and as he was, through his Tapasyá, become a son of MAha'-DE'va, she told him she considered him in that light, and would allow him to command over all the hills, trees, and plants in Vabni-st'bún. The hills then humbled themselves before St'ha'var-pati, and paid tribute to him.

The origin of Ninus is thus related in the fame sacred books. One day, as Maha'-de'va was rambling over the earth naked, and with a large club in his hand, he chanced to pass near the spot where several Munis were performing their devotions. MAHA'-De'va laughed at them, insulted them in the most provoking and indecent terms; and lest his expressions should not be forcible enough, he accompanied the whole with significant signs and gestures. The offended Munis cursed him, and the Linga or Pballus fell to the ground. MAHA $-\mathrm{DE}^{\prime} V A$, in this state of mutilation, travelled over the world, bewailing his misfortune. His consort too, hearing of this accident, gave herself up to grief, and ran after him in a state of distraction, repeating mournful songs. This is what the Greck mythologists
mythologists called the Wanderings of Dematers and the Lamentations of $\mathrm{Bacch} \boldsymbol{\mathrm { u }}$.

The world being thus deprived of its vivifying principle, generation and vegetation were at a stand; Gods and men were alarmed; but having discovered the cause of it, they all went in search of the sacred Ling a; and at last found it grown to an immense size, and endowed with life and motion.

Having worshipped the sacred pledge, they cut it, with hatchets, into one-and-thirty pieces, which Poly-pus-like, soon became perfect Lingas. The Devatas left one-and-twenty of them on earth; carried nine into Heaven, and removed one into the inferior regions, for the benefit of the inhabitants of the three worlds. One of these Lingas was erected on the banks of the Cumud-vati, or Euphrates, under the name of Ba'le'swara-Linga, or the Linga of Iswara the Infant, who seems to answer to the Jupiter Puer of the western mythologists. To satisfy $D_{E^{\prime}} \mathrm{V}_{\mathrm{I}}$, and restore all things to their former situation, Maha'-de'Va' was born again in the character of Bale'swa'ra, or Iswara the Infant. Ba1. E'SWA'rA, who fosters and preserves all, though a child, was of uncommon strength; he had a beautiful countenance; his manners were most engaging; and his only wish was to please every body; in which he succeeded effectually; but his subjects waited with impatience till he came to the age of maturity, that he might bless them with an heir to his virtues. Bale b'swa'ra, to pleafe them, threw off his childlike appearance, and suddenly became a man, under the title of Li'Le'swara, or Iswara, who gives
pleasure and delight. He then began to reign over Gods and men, with the strictest adherence to justice and equity : his subjects were happy, and the women beheld with extacy his noble and manly appearance. With the view of doing good to mankind, he put himself at the head of a powerful army, and conquered many distant countries, destroying the wicked, and all oppressors. He had the happincss of his subjects and of mankind in general so much at hearr, that he entirely neglected every other pursuit. His indifference for the female sex alarmed his subjects : he endeavoured to please them; but his embraces were fruitless. This is termed Asc'balana in Sanscrit; and the place where this happened was in consequence denominated Asc'balanst'bán. The Apsaras, or celestial nymphs, tried in vain the effect of their charms. At last Sami-Ra'ma' came to Ascobalanst'bán, and retiring into a solitary place in its vicinity, chanted her own metamorphoses and those of Li'le'swara, who happening to pass by, was so delighted with the sweetness of her voice, that he went to her and enquired who she was. She related to him how they went together into Utcoladésa in the characters of the Capo'teswara and Capote'si: adding, you appeared then as Mocshe'swa'ra, and I became Anay'asa; you are now Liléswara, and I am SàmiRàmà, but I shall be soon Liléstuar ì. Li'le'swara, being under the influence of $\mathrm{MA}^{\prime} \mathrm{Y} A$, or worldy il illusion, did not recollect any of these transactions; but suspecting that the person he was speaking to might be a manifestation of $P_{A}^{\prime}$ rvati, he thought it adviseable to marry her; and having obtained her
consent, he seized her hand, and led her to the performance of the nuptial ceremony, to the universal satisfaction of his subjects. Gods and men met to solemnize this happy union; and the celestial nymphs and heavenly quiristers graced it with their presence. Thus Sami-Ra'ma' and Li'le'swara commenced their reign, to the general satisfaction of mankind, who were happy under their virtuous adminiftration.

From that period the three worlds began to know and worship Li'le'swara, who after he had conquered the universe, returned into Cusba -duípa. $\mathrm{LI}^{\prime}-$ ine'swara having married Sami-Ra'ma', lived constantly with her, and followed her wherever she chose to go: in whatever pursuits and pastimes she delighted, in these alone he took pleasure; thus. they travelled over hills and through forests to distant countries; but at last returned to Cusba-duíp: and SAMI-R A $A^{\prime} A^{\prime}$ seeing a delightful grove near the Hradancità (or deep water) with a small river of the same name, expressed a wish that he would fix the place of their residence in this beautiful spot, 'there to spend their days in pleasure.

This place became famous afterwards, under the name of Lila-st'bán, or the place of delight. The water of the Hradancità is very limpid and abounds with Canala-flowers, or red Lotos.

Sami-Ra'ma' is obviously the Semiramis of the western mythologists, whose appellation is derived from the Sanscrit Sami-Ra'me'si', or Is $1^{\prime}$. (Isis) dallying in the Sami, or Fir-trec. The title of Sa-mi'-Rame'si is not to be found in the Puranás; but it is more grammatical than the other; and it is abfo-
lutely necessary to suppose the word Isi' or Esi in compostion, in order to make it intelligible.

Diodorus Siculus*informs us that she was born at Ascalon: the Puránás, that her first appearance in Syria was at Asc'balana-st'bán, or the place where Li'le'sia or Ninus had Asc'balana.

The defeat of Semiramis by Staurobates, is recorded in the Puránás with still more extravagant circumstances; for Staurobates is obviously St'ha'vara-pati, or St'ha'wara-pati, as it is more generally pronounced.

The places of worship mentioned in the above legends are Mócsbésa or Mócsha-st'bán, Asc'bala-st'bán or Asc'balana-st'bán, two places of the name of Lilast'bán or Lilésa-st'bán, Anáyásá-dévíst'bán and Ma-bá-bbágá-al'bán

The Brábmens in the western parts of India, insist that Mócsba-st' ${ }^{\prime}$ bán is the present town of Mecca. The word Mócsha is always pronounced in the vulgar dialects, either Moca or Mucta; and the author of the Dabistan says, its ancient name was Maca. We find it called Maco Raba, by Ptolemy, or Moca the Great or Illustrious. Guy Patra mentions a medal of Antoninus Pius with this legend, " mok iep axp, atto," which he very properly translates Moca, sacra, inviola~ bilis, suis utens legibus, "Moca the holy, the inviolable, and using her oron lawos." This, in my humble opinion, is applicable only to Mecca, or Mócsha-st'bán, which the Puránís describe as a most holy place. The Arabian authors unanimously confirm the truth of

* Diodorus Siculus, lib. 3. cap.z.

Vox. IV.
C f
the
the above legend; and it is ridiculous to apply it to an obscure and insignificant place in Arabia Petrea, called also Moca. It may be objected, that it does not appear that Mecca was ever a Roman colony. I do not believe it ever was; but at the same time it was possible that some connection for commercial purposes might have existed between the rulers of Mecca and the Romans in Egypt. The learned are not ignorant that the Roinans boasted a little too much of their progress in Arabia; and even medals were struck with no other view, apparently, but to impose on the multitude at Rome. It is unfortunate that we do not mect in the Puranás with the necessary dala to ascertain, beyond doubt, the situation of Mocsbea. From the particulars contained in them, however, it appears to have been situated a great way to the westward, with respect to India, and not from Egypt and Etbiopia, as has been shewn in a former dissertation on these countries, and in the third volume of the Asiatic Researches.

It is declarad in the Puránás that Capo'te'swara and his consort Capo'te'si, in the shape of two doves, remained there for some time; and Arabian authors inform us, that in the time of Mohammed, there was in the temple of Mecca a pigeon carved in wood, and another above this: to destroy which, Mohammed lifted Ali upon his shoulders. These pigeons were most probably placed there in commemoration of the arrival of 'MABA'-DE'va and $\mathrm{De}_{\mathrm{E}} \mathrm{V} 1$, in the shape of two doves.

The worship of the dove seems to have been peculiar to India, Arabia, Syria, and ADyria. We read of Semiramis being fed by doves in the desart; and of her vanishing at last from the sight of men, in the shape of a dove; and according to the Puránás, CAPo'te'si, or the dove, was but a manifestation of Sami-Ra'ma'.
The dove seems to have been in former times the device of the $A \int_{y r i a n}$, as the eagle was of the Roman empire; for we read in Isaias", "And the inhabi" tants of this country shall say in that day, such was " our expectation! behold whither we warited to fly "for help from the face of the dove but how could "we have escaped?"

I have adhered chiefly to the translatian of Tremeleius, which appears the most literal, and to be more expressive of the idea which the prophet wished to convey to the Feres, who wanted to fly to Egypt and Etbiopia, to avoid falling into the hands of the AJyrians; but were to be disappointed by the fall of these two empircs.

All commentators have unanimously understood Afyria by the Dove, and have translated the above passage accordingly. Capo'te's i, or the Assyrian Dove, was also mentioned in a song, current in these countries, and which seems to refer to some misfortune that had befallen the Afyrians. The 56 th Psalm is directed to be sung to the tune of that song, which was known to every body; and for this purpose the

[^12]first verse, as usual, is inserted. "The dove of disw " tant countries is now struick dumbb."

The Hindus further insist, that the black stone in the wall of the Caaba, iṣ no other than the Linga or Pbalw lus of Maha'-deva'; and that when the Caaba was rebuilt by Mohamaed, (as they affirm it to bave been) it was placed in the wall, out of contempt; but the new converted pilgrims would not give up the worship of the black stone; and sinistrous portents forced the ministers of the new religion to connive at it. Arabian authors also inform us that stones were worshipped all over Arabia, particularly at Mecca; and Al-shahrestani* says, that the temple at Meccuwas dedicated to Zohal or Kyevun, who is the sarne with Saturn. The author of the Dabistan declares possitively that the Hejar al aswad, or the black stone, was the image of Kyevux. Though these accounts somewhat differ from those in the Puránás, yet they shew that this black stone was the object of an idolatrous worship from the most remote times.

The Mussulmans, in order to palliate their idolatry towards it, have contrived other legends. Kyevun is the Chyun of Scripture, also called Remphan, which is interpreted the God of Time. If so, Chyun, or Kyeven, must be Maha'-de'va, called also Ma-HA'-CA'LA, a denomination of the same import with Rempian; the Egypiaias called Horys, the lord of time; and Horus is the same with Hara, or Ma-Ha'-DE'vat.

[^13]The reason of this tradition is, that the Scbions, tho worshipped the seven planets, seem to have considered SATURN as the lord of time, on account of the length of its periodical revolution; and it appears from the Dabistan, that somic ancient tribes in Persios had contrived a cycle of years, consisting of the revelution of Saturn repeatedly multiplied by itself.

Asc'hala-st'ha'n, or Asc'balana-st'béri, is obviously Ascalon; there Semiramis was born', according to Diodorus Siculus, or, according to the Purénás, there she made her first appearance.

MAHA $A^{\prime}-B I A^{\prime} \mathrm{CA}^{\prime}-\mathrm{St}^{\prime} \mathrm{HA}^{\prime} \mathrm{N}$ is the st'ban or place of Sami' - Ra'má $^{\prime}$, in the characters of Maha-bHa'ga', or the great and prosperous goddess. This implies also that she bestowed greatness and prosperity to her votaries.

We cannot but suppose that the st mánio of MAA SHA 'GA' is the ancient town of Mabog called now Meribigぇ and Menbig; the Greeks called it Hierapolis, or the holy city: it was a place of great antiquity; and there was a famous temple dedicated to the Syrion goddess, whose statue of gold was placed in the center, between those of Jupiter and Juno. It had a golden dove on its head; hence some supposed it was designed for Semiramis, and it was twice every year carried to the sea-side in procession, This statue was obviously that of the great goddess, or $\mathrm{Ma}_{\mathrm{A}}$ HA'BHA'GA'-DEVI', whose history is intimately connected with that of the Dove in the western mythologists, as well as in the Puránís.

An ancient author * thus relates her origin: "di" citur et Euphratis fluvio ovum piscis Columba adse" disse dies plurimos, et exclusisse Deam benignam et "misericordem hominibus ad bonam vitan." "It " is related that a Dove hatched the egg of a fish, " near the Euphrates, and that after many days of in"cubation came forth the Goddess, merciful and pro"pitious to men, on whom she bestows cternal bliss." Others say that fishes rolled an egg upon dry land, where it was hatched by a Dove, after which appeared the Syrian Goddess.

Her origin is thus related in the Puranás: The Taramas having for a long time vexed the inhabitants of Culba-duíp, they at last applied for protection to $M A A A^{\prime} H A^{\prime}-B H A^{\prime} G A^{\prime}-D E^{\prime} V I$, who had already appeared in that country in the characters of Sami-Ra'ma' and Capote'si', or Isi', in the shape of a Dove; they requested also that she would vouchsafe to reside amongst them. The merciful Goddess granted their request; and the place where she made her abode was called the $s l^{\prime}$-bán, or place of Mábámbbágá.-

The Syrian name of Mabog is obviously derived from MAHA'-BHA'ga'. This contraction is not uncommon in the western dialects, derived from the Sanscrit ; and Hesxchius informs us that the Greeks pronounced the Hindu word Mabágreat, Mai. Mabog is mentioned by Pliny, where we read Magog ; but Mr. Danvilie shews that it should be Mabog: I conclude from some manuscript copies. This is also

[^14]confirmed by its present name, which is to this day Manbig or Manbeg. We find it also called Bambukeb (Bapelex.) Eambyce); and in Niebuhr's Travels it is called Bombädscbe: I supposs for Bombäksche or Mombigz: but this is equally corrupted from Ma'ábhágá. In the same manner we fay Bombay for Momba; and what is is called in India Bambu or Pambu, is called Mambu in Thibet.

The temple of Mabog was frequented by all natious; and amongst them were pilgrims from India, according to Lucian, as cited by the author of the Ancient Univerfal History.

Máboc, or Hierapolis, was called also Old Ninus, or Ninivec, according to Ammianus Marcellinus, and Puilostratus: and there is no mistake in Diodorus Siculusand Ctesias, when they assert that there was a town called Niniveb near the Eupbrates. Scripture also seems to place Niniveb thereabout ; for it is said that Rezen was between Niniveb and Calach. And the situation of Rezen, catled also Resaina, by ancient authors, and Razain by the moderns, is well known, as well as that of Calach on the banks of the Lycus, now the $Z a b$, to the eastward of the Tigris. Niniveh, of course, must have been to the westward of these two places, and falls where the Old Ninus is pointed out by Ammianus, Phiostratus, \&cc.

Two places of that name are mentioned in the $P u_{-}$ ránás, under the name of Lilast'bán, the st'bán or place of Li'le'sa or Ninus. Therecan be no doubt, in my humble opinion, of their identity; for Sami'Ra'ma'is obviously Semiramis. Ninus was the son of Belus, and, according to the Paránás Li'le'sa

C c 4
sprung
sprung from Ba'le'swara, or Balesa; for both denominations, being perfectly synonimous, are indifferently used in the Puránás.

Niniveh on the Tigris, seems to be the st'bán of $\mathrm{LI}^{\prime} \mathrm{LE} E^{\prime} \mathrm{S}$, where he laid aside the shape and countenance of $B_{A}^{\prime} L E^{\prime} S A$, and assumed that of $L_{1}^{\prime} L e^{\prime} S A$. The other placeof Lilesa, which Sami'- Ra'ma', delighted with $^{\prime}$ the beauty of the spot, chose for the place of her residence, is Hierapolis, called also Ninus or Ninevch: hence we find her statue in the temple of Maha''bha'Ga'. It is said to have been situated near a deep pool, or small lake, called from that circumstance Hradancità; and the pool near the temple of Hierapolis was described to be two hundred fathoms deep. Sa$m I^{\prime}-R_{A}{ }^{\prime} m A$ is represented in a most amiable light in the Purinás, as well as her consort Lile'swara, or Lile'sa.

Stephanus of Byzantium says that Ninus lived at a place called Telané, previous to his buiding Ni niveb; but this place, I believe, is not mentioned by any other author.

Ninus is with good reason supposed to be the Assur of Scripture, who built Niniveh; and Assur is obviously the Is'wara of the Puránás, with the title of Li'le'sivara, Li'lesa, or Ninus. The word I'swara, though generally applied to deities, is also given in the Purárás to Kings ; it signifies Lord and Sovereign.

With respect to the monstrous origin of $\mathrm{Be}^{\prime} L E^{\prime} S A$, and the thirty-one Pballi; my Pandit, who is an astronomer suspects it to be an attempt to reconcile the course of the moon to that of the sun, by divid-
ing the synodical revolution into thirty-one parts, which may represent also three hundred and ten years. As this correction is now disused, he could give me no further information concerning it. To the event related is ascribed the origin of the Singa or Pbalitis, and of its worship : it is said to have happened on the banks of the Camud-vati, or Eupbrates; and the first Pballus, under the name of Balefroara-Livgra, was erected on its banks. This is confirmed by DIodorus Siculus, who says that Semiramus brought an Obelisk from the mountains of Armonia, and erected it in the most conspicuous part of Babyion: it was 150 feet high, and is reckoned, by some author, as one of the seven wonders of the world *. The Fews in their Talinud allude to something of this kind; speaking of the different sorts of earths, of which' the body of A dan was formed, they fay that the earth which composed his generative parts, was brought from Babylonia.

Tienext place of worship is the st'ban of ANA'YA'
 Anaias) of Strabo, or the temple of the goddess Anaia, or Anaias, with its burning spring of NAphtha. They are upon a hillock, called Corcura by the antients, and now known by the name of Corcoor: it is near Kerkook, and to the castward of the Tigris. To this day it is visited by pilgrims from India; and I have been fortunate enough to meet with four or five who had paid their devotions in this holy place. I consult-

[^15]ed them separately, and their accotints were as satist factory as could be expected. They call it fuáláo muc'bž, or the flaming mouth.

This conflagration is minutely described by Drodorus Siculus*, who says, that in former times a monster called Alcida, who vomited flames, appeared in Phrogia; hence spreading along mount Taurus; the conflagration burnt down all the woods, as far as India : then, with a retrograde course, swept the forests of mount Liban, and extended as far as Egypt and Africa: at last a stop was put to it by Minerva.

The Pbrygians remembered well this conflagration and the flood which followed it; but as they could not conceive that it could originate from a benevoless Goddess, they transformed her into a monster; called A icida. Alcida howeveris an old Greek word, implying strength and power, and is therefore synonimous with Sácá or Sactu-devi, the principal form of Sasmí-RA'MA', and other manifestations of the female power of nature.

Indeed the names and titles of most of the Babylonian deities are pure Sanscrit: and many of them are worshipped to this day in India, or at least their legends are to be found in the Puránás.

Thus Semiramis is derived from Samí-Rámési, or Sámi-Ramá, and Sami-Rámáa déví.

Militta from Militia-Devi, because she brings people together (Connuba).

* Drod. Sic. lib. 4. cap. 5.

Shacka, or Saca, is from the Sanscril Sacta-dívis prononced Sácá in the vulgar dialects: it implies strength and power.

Slamba, or Salambo, is from Surzémbá, often pronounced Salwámba: it signifies the mother of all: and she is the Marrua Mater of the western mythologists.

De'vi is called also A'nturgeti, or Antargatá, because she resides within the body, or in the heart, and thereby gives strength and courage. This is the Goddess of Victory in India, and they have no other: it is declared in the Puranás, that she was called $\mathrm{A}^{\prime} \mathrm{N}$ trasteri (atitle of the same import with the former) in the forests of Visbala-vian, on the banks of the river Tamasa, in Cbándra-duīp: from $A^{\prime} n t r a s t^{\prime} b i$ the old Britons, or rather the Romans, made Andraste.

The Babylonian Coddess was called also the Queer of Heaven; and to this day a form of $D_{E v i}$, with the title of Sverga rádni-dévi, or Devi, Queen of Heazen, is worfhipped in India.
Ries is from Hriyadedevi, or the bashful or modest Goddess.

Rakh is from Rácéswara: a name of Lunus, from one of his favourite wives called Raca: it signifies also the full orb of the Moon.

Nabo, or Nebo, is I'swara, with the title of Nava, or Naba, the celestial.

Nargal is from Anargaléswara; that is, he who is independent.

Adram-melech is from $A^{\prime} d b a r m-e s w a r a ; ~ f o r ~$ I'swara

I'swara and Melecir, in the Cbaldean languages are synonimous.

Adharméswara is thus called, because he punishes those who deviate from the paths of justice and rectitude.
Anam-melech is from Anam-észuario or Is'wara; who, though above all, behaves to all with meekness and affability.
Nimrod is from Nema-Rudra, bécause Rudra or Maha'-de'va gave him half of his own strength.
Vahni-st'ha'n, called also Agni-st'bán is said in some Purínás to be in Cusbia-duíp; and in others, to be on the borders of it. It includes all the mountainous country from Pbrygia to Herat. Vabni-st'bán and Agni-st'bán are denominations of the same import, and signify the country or seat of fire, from the numerous volcanoes and burning springs which are to be found all along this extensive range of mountains. The present Azar-Baijain is part of it, and may be called Vabni-stban proper. Azar, in the old Persian, signifies fire; and Báiján, a mine or spring: This information was given to me by Mr. Duncan; resident of Benarcs, who was so kind as to consult on this subject with Mendi-Ali-Kia'n, one of the $A u-$ mils of the Zemindary of Benares. He is a native of Khorassan, and well acquainted with the antiquities of his own country, and of Iram in general. According. to him, the principal Buijan, or spring of fire, is at a place called Bout-Cubeb ${ }^{*}$, in $A \approx a r-$ Baiján. Vabni $=$

[^16]st'bán is called also Vabni-vyápta, from the immense quantity of fire collected in that country. There are many places of worship remaining throughout Iran, still resorted to by devout pilgrims. The principal are Balk and the Pyreunn, near Herat. Hingláz, or Anclooje, near the sea, and about cighty miles from the mouth of the Indus: it is now deserted; but there remain twenty-four temples of Bhavi'si. This place, however, is seldom visited, on account of the difficulties attending the journey to it.

Ganga'wa'z, near Congo, on the Persian Gulph, another place of pilgrimage, where are many caves, with springs in the mountains.

The st'bán of Calya'sa-Ra'ya and GovindaRa'ya, two incarnations of Vishnu, is in the centre of Bussora, on the banks of the Eupprates; and there are two statues carefully concealed from the sight of the Mussulinans.

Ava'Ya'sa' $\mathrm{De}^{\prime}$ vi-st'Ha's has been already mentioned; and the great Yuallá-muc'bi is the designation of the springs of Naphtba, near Baku.

There is also another Hindiu place of worship at Babarein (El Katif) and another at. Astrachan, where the few Hindus who live there worship the Volga, under the name of $\mathrm{SU}^{\prime} \mathrm{RYA}-\mathrm{MUC} \mathrm{C}^{\prime} \mathrm{HI}^{\prime}-\mathrm{GANGA}$; the legends relating to this famous river are to be found in the Puranás, and confirm the information of the pilgrims who have visited these holy places. There are still many Hindus dispersed through that immense country ; they are unknown to the Mussulmans; and they pass for Gucbris, as they call them here, or

Parsis.

Parks. There is now at Bemares a Brabman of the name of De'vi-ds's, who is a native of Mefched; he was introduced lately to my acquaintance by Mr. Duncan; and he informed me that it was supposed there were about 2000 families of Hindus in Khoraffan; that they called themselves Hindi, and are known to the Muffulmans of the country under that appellation.

This, in my opinion, accounts for the whole country to the south of the Cafpian sea, from Kboraffan and Arrokbage, as far as the Black Sea being called India by the antients; and its iahabitants in various places Sindi; it is implicitly confirmed by the Puránás, in which it is said that the Surrya-muc"hz-Gangá, or Volga, falls into the Sea of Sind. The Hindus near Baku and at Afrachan, call it the new sea, because they say it did not exist formerly. They have legends about it, which, however, my learned friend Vidmaína'tir couid not find in the Puramás.

According to the pilgrims I have consulted, there are about twenty or thirty families of Hindus at Balk; and Eusebius informs us, that there were Hindus in Bactriana in his time. There are as many families at Gánģãoáz, or Congo; about one hundred at Buffora; and a few at Babarein: these informed Pura'-NA'-puri', a Yöyz and famous traveller, called also U'rd'hwaba'hu, because he always keeps his hands elevated above his head, that formerly they corresponded and traded with other Hindus on the banks of the river Nila, in the country of Mifr; and that they had once a house or factory at Cairo; but that,
that, on account of the oppression of the Turks and the roving Arabs, there had been no intercourse between them for several generations. There are no Hindus at Aníyásâdévì, or Corcoor; but they compute a large number in the vicinity of Baku, and Derbend. The Shroffs at Sámákbi are Banyans or Hindus, according to the Dictionary of Commerce, and of Trevoux, as cited in the French Encyclopædia*.

The Cubánís who live near Derbend, are Hindus, as my friend Purana-Puri was told at Baku and Afracban, in his way to Mofcow; and their Bráhmens are said to be very learned; but, as he very properly observed, this ought to be underftood relatively ona comparison with the other Hindus in Perfia, who are extremely ignorant.

His relation is in a great measure confirmed by Strablenberg, who calls them Cuba and Cubatzin; and says that they live near Derbend, and are a distinct people, supposed to be Fews, and to speak still the Hebrew language.

The Saufcrit characters might easily be mistaken for the black Hebrew letters by superficial observers, or persons little conversint in subjects of this nature.

The Arani, figuratively called the daughter of the Sami-tree, and the mother of fire, is a cubic piece of wood about five inches in diameter, with a small hole in the upper part. A stick of the same sort of wood is placed in this cavity, and put in motion by a string held by two men, or fixed to a bow. The friction

[^17]soon produces fire, which is used for all religious purposes, and also for dressing food. Every Brabmen ought to have an Arani; and when they cannot procurc one from the Sami'-tree, which is rather scarce in this part of India, they make it with the wood of the Asvatt'ba, or Pippala-tree. This is also a sacred tree, and they distinguish two species of it ; the Pippalc, called in the vulgar dialects Pipal, and the Chalatpalcsho. The leaves of this last are larger, but the fruit is smaller, and not so numerous as in the former specics. It is called Chalat-palasba, from the tremulous motion of its leaves. It is very common in the hills, and the vulgar name for it is Pópala; from which I suppose is derived the Latin word Populus; for it is certainly the trembling Poplar or ASpen-tree.

The festival of Simiramis falls álways on the tenth day of the lunar month of Aiwina, which this year coincided with the fourth of October. 'On this day lamps are lighted in the evening under the Samitrec; offerings are made of rice and flowers, and sometimes strong liquors; the votaries sing the praise of Sami'-Rama'-devi' and the Semítree; and having worshipped them, carry away some of the leaves of the tree, and earth from the roots, which they keep carefully in their houses till the return of the festival of Semiramis in the ensuing year.

XXVII.

> ON THE ANDAMAN ISLANDS.

BY LIEUT. R. H. COLEBROOIKE.

THE Andaman islands are situated on the castern side of the bay of Bengal*, extending from north latitude $10^{\circ} 32^{\prime}$ to $13^{\circ} 40^{\prime}$. Their longitude is from $92^{\circ} 6^{\prime}$ to $92^{\circ} 59^{\prime}$ east of Greenzerch. The Great Andaman, or that portion of the land hitherto so called, is about one hundred and forty British miles in length, but not more than twenty in the broadest parts. Its coasts are indented by several deep bays, affording excellent harbours, and it is intersected by many vast inlets and creeks, one of which has been found to run quite through, and is navigable for

[^18]small vessels. The Little Andaman is the most southe crly of the two, and lies within thirty leagues of the island Camicobar. Its length is 2.8 miles by if in breadth, being more compact, but does not afford any hatbour, although tolerable anchorage is found near its shores. The former is surrounded by a great number of smaller islands.
'THe shores of the main island, and indeed of all the rest, are in some parts rocky, and in a few places are lined with a smooth and sandy beach, where boats may easily land. The interior shores of the bays and crecks are almost invariably lined with mangroves, prickly fern, and a species of wild rattan; while the inland parts are covered with a variety of tall trees, darkened by the intermixture of creepers, parasitc plants, and underwood; which form altogether a vast and almoft impervious forest, spreading over the whole country. The smaller islands are equally covered with wood; they mostly contain hills of a moderate height, but the main island is distinguished by a mountain of prodigious bulk, called from its shape the Saddle-Peak; it is visible in clear weather at the distance of twenty-five leagues, being nearly two thousand four hundred feet in perpendicular height. There are no rivers of any size upon these islands, but a number of small rills pour down from the mountains alfording good water, and exhibiting in their descent over the rocks a variety of little cascades, which are overshaded by the superincumbent woods.

Trie soil is various in different parts of these islands:
islands*; consisting of black rich mould, white and dark coloured clays, light sandy soil, clay mixed with pebbles of different colours, red and yellow earth; but the black mould is most common. Some white cliffs are met with along the shores, which appear to have been originally clay, with a mixture of sand, hardened by time into the consistence of stone, but might be cut, and would probably answer for building. Near the southern extremity of the great island, where it is mountainous and rocky, some indications of minerals have appeared, particularly of tin. There is also a kind of freestone, containing a yellow shining spar, resembling gold dust. Some of the hills bordering the coasts exhibit blue shistous strata at their bases, with the Brescia or pudding-stone; and some specimens of red ochre have been found, not unlike cinnabar.

The extensive forests with which these islands are over-run, produce a variety of trees fit for building, and many other purposes. The most common are the poon, dammer, and oil-trees; red wood, ebony, cot-ton-tree, and buddaum or almond-tree; soondry, chingry, and bindy; Alexandrian laurel, poplar, and a tree resembling the sattin-wood; bamboos, and plaas, with which the natives make their bows; cutch, affording the extract called Terra Fuponica; the Melori, or Nicobar bread-fruit ; aloes, ground rattans, and a variety of shrubs. A few fruit-trees have been

[^19]found in a wild state ; but it is remarkable that cocoanuts, so commion in other tropical countries, are here almost unknown. Many of the trees afford timbers and planks fit for the construction of ships, and others might answer for masts. A tree grows here to an enormous size, one having been found to measure thirty fect in circumference, producing a very rich dye, that might be of use in manufactures.

The only quadrupeds yet discovered in these islands are widd hogs, monkeys, and rats. Guanas, and various reptiles abound; among the latter is the green snake, very venomous; centipedes of ten inches long, and scorpions.

A variety of birds are seen in the woods; the most commonare pigeons, crows, parroquets, king fishers, curlews, fish-hawks, and owls. A species of humming bird, whose notes are not unlike the cuckoo, is frequently heard in the night.

The principal caverns and recesses, composing part of the coast, give shelter to the birds that build the cdible nests: an article of commerce in the China market, where they are sold at a very high price. It has been thought that these nests are formed from a gluinous matter exuding from the sides of the caverns where these birds, during their nidification, resort. It is not known whetherthey emigrate; but the period of their incubation takes place in Deceniber, and continues till May. Not more than two white spotless eggs have been found in their nests; but they have been further supposed to breed monthly.

Tres harbours and inlets from the sea are plentifully stocked with a variety of fish; such as mullets, soles,
tromfret; rock-fish, skate, gurnards, sardinas, roeballs, sable; shad, aloose, cockup, grtbers, seer-fish, old wives, yellow tails, snappers, devil-fish, cat-fish, prawns, shrimps, cray-fish, and many others: a species resembling the whale, and sharks of an enormous size, are met with. A variety of shell-fish are found on the reefs, and in some places oysters of an excellent quality. Of the many madrapores, coralines, zoophites, and shells, none have yet been discovered but such as are found elsewhere.
The Andaman islands are inhabited by a race of men the least civilized, perhaps, in the world; being nearer to a state of nature than any people we read of. Their colour is of the darkest hue, their stature in general small, and their aspect uncouth. Their limbs are ill formed and slender, their bellies prominent, and, like the Africans, they have woolly heads*, thick lips, and

[^20]406 ON THE ANDAMAN ISLANDS.
flat noses. They go quite naked, the women wearing only at times a kind of tassel, or fringe, round the middle; which is intended merely for ornament, as they do not betray any figns of bashfulness when seen without it. The men are cunning, crafty, and revengeful ; and frequently express their aversion to strangers, in a loud and threatening tone of voice, exhibiting various signs of defiance, and expressing their contempt by the most indecent gestures. At other times they appear quiet and docile, with the most insidious intent. They will affect to enter into a friendly conference, when after receiving with, a show of humility whatever articles may be presented to them, they set up a shout, and discharge their arrows at the donors. On the appearance of a vessel or boat, they frequently lie in ambush among the trees, and send one of their gang, who is generally the oldest among them, to the water's edge, to endeavour by friendly signs to allure the strangers on shore. Should the crew venture to
should be true; in which case they might probably retain a tradition of having once been in a state of slavery. This in some degree would account for the rancour and enmity they shew ; and they would naturally wage perpetual war with those whom they might suspect were come to invade their country, or enslave them again.
It would appear that these islands were known to the antients (sce Major Rennel's Memoirs, introduction, page xxxix). They are mentioned, I believe, by Murco Polo; and in the ancient accounts of India and Cibina, by two Mabomedan travellers, who went to those parts in the ninth century (translated from the Arabic by Eusebiug Renaudot) may be seen the following curious account. "Beyond "these two islands (Nejabalus, probably Nicobars) lies the sea of Anda" man; the people on this coast eat human flesh quite raw ; their com" plexion is black, their hair frizzled, their countenance and eyes, " frightful, their feet are very large and almost a cubit in length, " and they go quite naked. 'They have no embarkations; if they had, "they would devour all the passengers they could lay hands on, \&c."
land without arms, they instantly rush out from their lurking places, and attack them. In these skirmishes they display much resolution, and will sometimes plunge into the water to seize the boat; and they have been known even to discharge their arrows while in the act of swimming. 'Their mode of life is degrading to human nature, and, like brutes, their whole time is spent in search of food. They have yet made no attempts to cultivate their lands, but live entirely upon what they can pick up, or kill. In the morning they rub their skins with mud, or wallow in it like buffaloes, to prevent the annoyance of insects, and daub their woolly heads with red ochre, or cinnabar. Thus attired, they walk forth to their different occupations. The women bear the greatest part of the drudgery in collecting food, repairing to the reefs at the recess of the tide, to pick up shell-fish, while the men arehunting in the woods, or wading in the water to shoot fish with their bows and arrows. They are very dexterous at this extraordinary mode of fishing, which they practice also at night, by the light of 'a torch. In their excursions through the woods, a wild hog sometimes rewards their toil, and affords them a more ample repast. They broil their meat or fish over a kind of grid, made of bamboos; but use no salt, or any other seasoning.

The Audwaners display at times much colloquial vivacity, and are fond of singing and dancing; in which amusements the women equaliy participate. Their language is rather smooth than guttural; and their melodies are in the nature of recitative and cho-

$$
\text { Dd } 4 \quad \text { rus, }
$$

rus, not unpleasing. In dancing they may be said to have improved on the strange republican dance asserted by Voltaire to have been exhibitedin England: "Ou dancont al la conde, chacun donne des coups de pieds " a son voisin, et en recoit autunt." The Andamaners likewise dancing in a ring, each alternately kicking and slapping his own breech, ad libitum. Their salutation is performed by lifting up a leg, and smacking with their hand the lower part of the thigh.

Tifir dwellings are the most wretched hovels imaginable. An Andaman hut may be considered the rudest, and most imperfect attempt of the human race to procure shelter from the weather, and answers to the idea given by Vitruvius, of the buildings erected by the earlicst inhabitants of the earth. Three or four sticks are planted in the ground, and fastened together at the top, in the form of a cone, over which a kind of thatch is formed with the branches and leaves of trees. An opening is left on one side, just large enough to creep into; and the ground beneath is strewed with dried leaves, upon which they lie. In these huts are frequently found the sculls of wild hogs, suspended to the roofs.

Their canocs are hollowed out of the trunks of trees by means of fire and instruments of stone, having no iron in use amongst them, except such utensils as they have procured from the Europeans and sailors who have lately visited these islands; or from the wrecks of vessels formerly stranded on their coasts. They use also rafts, made of bamboos to transport themselves across their harbours, or from one island
to another. Their arms have already been mentioned in part, I need only add that their bows are remarkably long, and of an uncommon form ; their arrows are headed with fish-bones, or the tusks of wild hogs; sometimes merely with a sharp bit of wood, hardened in the fire, but these are sufficiently destructive. They use also a kind of shield; and one or two other weapons have been seen amongst them. Of their implements for fishing, and other purposes, little can be said. Hand-nets of different sizes are used in catching the small fry, and a kind of wickerbasket, which they carry on their backs, serves to deposit whatever articles of food they can pick up. A few specimens of pottery-ware have been seen in these islands.

Tree climate of the Andaman islands is rather milder than in Bengral. The prevailing winds are the south-west and north-east monsoons, the former commencing in May, and bringing in the rains; whicte continue to fall with equal, if not greater, violence till November. At this time the north-east winds begin to blow, accompanied likewise by showers, but giving place to fair and pleasant weather during the rest of the year. These winds vary but little, and are interrupted only at times by the land and sea-breezes. The tides are regular, the floods setting in from the west, and rising eight feet at the springs, with little variation in different parts. On the north-east coast it is high water at the full and change of the moon at $8^{\circ} 33^{\prime}$. The variation of the needle is $z^{\circ} 30^{\prime}$ castcrly.

XXVIII.

ON BARREN ISLAND, AND ITS VOLCANO.

## BY LIEUT. R. H. COLEBROOKE.

ABOUT fifteen leagues to the eastward of the An m daman islands lies an island which navigators, from its appearance, have justly called Barren. On the 12th of May 1787, Captain Kyd and myself, being on board the Trial Snow, on a voyage to Pul Penlng, Barren Island in sight, bearing SSW. seven leagues distant, saw a column of smoke ascending from its summit, and by the help of our glasses plainly perceived it to arise from a hill nearly in its center, around which appeared an extensive valley, or crater; but being becalmed, we could not approach nearer to examine it.

The following account of this remarkable island is given by Captain Blair, in his report of the Survey of the Andaman islands.
" I left that coast March the 21st, and landed on "Barren Island on the 24th. -The volcano was in " a violent state of eruption, bursting out immense " volumes of smoke, and frequently flowers of red " hot stones. Some were of a size to weigh three or " four tons, and had been thrown some hundred " yards past the foot of the cone. There were two

8. or three eruptions while we were close to it ; seve"ral of the red hot stones rolled down the sides of "the cone, and baunded a considerable way beyond "us. The base of the cone is the lowest part of the " island, and very little higher than the level of the "r sea. It arises with an acclivity of $32^{\circ} 17^{\prime}$ to the " hight of 1800 feet nearly, which is also the cleva"tion of the other parts of the island.
"Fromits present figure, it may be conjectured "that the volcano first broke out near the centre of "the island, or rather towards the north-west; and " in a long process of time by discharging, consum" ing, and undermining, has brought it to the pre"s sent very extraordinary form, of which a very cor"rect drawing by Lieutenant Wales, will impressa " distant iuea.
"Those parts of the island that are distant from "the volcano, are thinly covered with withered "shrubs and blasted trees. It is situated in latitude " $12^{\circ} 15^{\prime}$ north, and fifteen leagues east of the nor"thernmost island of the Archipelago *, and may be " seen at the distance of twelve leagues in clear wea"ther. A quarter of a mile from the shore, there is " no ground with 150 fothoms of line."

## R EMARK.

From the very singular and uncommon appearance of this island, it might be conjectured that it has been thrown up entirely from the sea, by the action

[^21]of subterrancan fire. Perhaps, but a few centuries ago, it had not reared itself above the waves; but might have been gradually emerging from the bottom of the ocean long before it became visible; till at length it reaclied the surface, when the air would naturally assist the operation of the fire that had been struggling for ages to get vent, and it would then burst forth. The cone or volcano would rapidly increase in bulk, from the continual discharge of lava and combustible matter ; and the more vioient cruptions which might have ensued at times, when it would throw up its contents to a greater clevation and distance, might have produced that circular and nearly equidistant ridge of land we see around it.

If this conjecture should gain credit, we may suppose not only many islands, but a great portion of the habitable globe, to have been thrown up by volcanos, which are now mostly extinguished. Many hills and jslands now clothed with verdure, bear evident marks of having once been in this state. A ground plan of Barren island would so exactly resemble some of the lunar spots, as seen through a good telescope when their shadows are strong, that I cannot help thinking there are also many more volcanos in the moon than have yet been discovered by a celebrated modern astronomer*. Those remakable valleys, or cavities, discernible on her disk, have many of them a single

* Herschelf。
hill in their center, and are surrounded by a circular ridge of a similar appearance.

Query. May not the moon be surrounded by ant atmosphere of pure air, which differing cssentially in its properties from the atmosphere of ourearth, might account for some of the phenomena of her appearance to us? An atmosphere of this sort might be so transparent as not to refract the rays of light in a sensible degree, or to produce the least change in the appearance of a star passing through it when an occultation is observed. At the same time, it would increase in a high degree, the infiammability and combustion of matter, so as to produce volcanos; and if we suppose the moon to have neither seas nor vegetation on her surface, the sun's light would be more strongly reflected than from the earth, where the rays are liable to absorption by water and vegetables.

## XXIX

Extrail from a Diary of a Fourney over the Great Desart, frome Alicppo to Bussora, in April 1782. Coinnunicaled by Sir William Dunkin, and publishedwitho a viero to direat the aticntion of future Travellers io the Ruins described in it.
april if.

SET off at five in the morning; encamped at five in the evening; the day intensely hot; the soil in general sandy; some few shrubs and bufhes, but now quite brown, and so dry, that with the least touch they fall to powder; many stalks of lavender and rosemary ; and in very dry red sand several scarlet tu.. lips; other sorts new to me, one of a singular kind, in colour and smell like a yellow lupin, but in figure like the cone of a fir-tree, from ten to twelve inches long.

After about two hours in this sort of country, the ground appeared more verdant and firm ; we then came to some very extraordinary ruins our Sbaikh had seen, but never had approached them before; we prevailed on him; he called the place Castrobuoin; another Arab called it Calnay; our Armenians, who interpreted for us in very bad Italian, called it Castro duo fratilli (I try to give the names from their mode of pronouncing) ; what we first saw was a square, each side about 402 yards along. The walls forty feet high,
highi, yet entire in many places; at each angle there is a circular tower, two others in each of the sides; they rise much higher than the walls; the towers and the walls constructed with very large blocks of cut stone. To what use the hollow of the square had been applied, I could form no conjecture; in it immense blocks of cut stone, and segments of archics of different dimensions, tumbled together in monstrous heaps; near to the gateway by which we entered, two arches remain perfect, a third nearly so; they were probably carried all along the inside of (but distinct at least twenty feet from) the wall. These arches spring from very slender pillars, each pillar a single shaft ; the arches are nearly semicicular, of the same beautiful white stone as the pillars. About a quarter of a mile from this square there is another, which appears to be a fourth part less; the entrance into this is under the loftiest as well as the widest arch of stone I ever saw: I had no means of measuring, which I inuch regretted: I cannot draw, which I regretted much more. The proportions of the pillars, and of the arch which they support, conveyed to me something more just and beautiful than I can describe. The inside of the arch is richly ornamented with sculpture; at the sides there are niches, I suppose, for statues; the outer face of the building is composed of great blocks of stone as the greater square; and in many places yet entire, appear to be as wel! chisseled and jointed as the best constructed marble building I ever saw, even at Venice. The height of the wall seems to be equal to that of the greater square ; the thickness, which from some

[^22]breaches quite through may be observed, from severi to eight feet, all through of the same stone, with little, if any, cement: the number and disposition of the towers the same as in the other; but ị this, where the towers rise above the wall, they are more ornamented; two circles or bands of sculpture at equal distances appear relieved from the body of each tower; but as all the tops are broken off, I could not guess how they had been closed. The sculpture on the inside of the great arch of entrance, and on many of the fragments of prostrated pillars, appear like those of Mr. Wood's plates of the ruins of Palmyra. Over the entrance-arch on the inside, are some remains of an inscription in Arabic; but so defaced, that our Sbaikh, who reads and writes Arabic, could not make out one word. All along the inside of this square, arches formed of the finest brick are constructed; they project from the wall about thirty feet, and are about twenty feet high over the arches; and close up to the wall is a platform of earth perfectly level, and now covered with rich and verdant herbage. No vestige of builde ings appear in the hollow of this square, but many fragments of pillars lie in ruins; some are of brick and so cemented, that it must be as difficult to separate their parts as if they were solid blocks of stone. There are no openings in the walls from which any thing could have been discharged; in the to wers there are openings, at regular distances, which seem to have been designed to admit light only: not for any hostile purpose. Equidistant from each of the squares is a building of the same sort of stonci, about fifteen
feet square, though it appears to have been much higher, it is still considerably more lofty than the other buildings : the stairs by which this was ascended appear perfect from about twelve feet above the grotund ; what were lower, now a heap of rubbish; there does not remain the appearance of any communication between this and the other buildings; all the interjacent ground is level, and now verdant; no stream or well appears nearer than the well we stopt at yesterday, about six hours from hence. If this district could be supplied with water, it would be rich indeed; for several miles onward we thought we discovered the remains of trenches or cuts for the conducting of water over the plain. The Arabs were entirely ignorant respecting these extraordinary buildings; when, or by whom erected, or when destroyed. The Sbaikb hurried us away, very much dissatisfied that we had lost so much time; he swears he never will come near it again : the distance from Aleppo is six days casy journey. The Sbaikbsays that we are now about forty miles from Palmyra, which is on our right, and about fifty from the Eupbrates, on our left. No person at Aleppo gave me any hint of such a place. The gentlemen of our factory at Bussora had never heard of it.

> XXX.

## PROSOPIS ACULEATA. KCENIG.

Tsbamie of the Hindus in the Nortbern Circars.

BY DOCTOR ROXBURGH.

THIS grows to be a pretty large tree, is a native of most parts of the coast, chiefly of low lands at a considerable distance from the sea, and may be only a variety of $P$. Spicigera, for the thorns are in this sometimes wanting ; flowers during the cold, and beginning of the hot seasons.
Trunk tolerably erect, bark deeply cracked, dirty ash colour.
Branches irregular, very numerous, forming a pretty large shady head.
Prickles scattered over the small branches; in some trees wanting.
Leaves alternate, generally bipinnate, from two to three inches long; pinnæ from one to four, when in pairs opposite, and have a gland between their insertions.
Leaflets opposite, from seven to ten pair, obliquely lanced, smooth, entire, about half an inch long, and one-sixth broad.
Stipules norie.
Spikes several, axillary, filiform, nearly erect.

3 RACTS minute, one-flowered, falling. Flowers numerous, small, yellow, single, approximated.
Calyx below, five toothed.
Filaments united at the base. Anthers incumbent, a white gland on the apex of each, which falls off soon after the flower expands. Style crooked. Stigma simple.
亡egume long, pendulous, not inflated. SEEDS many, lodged in a brown mealy substance.

The pod of this tree is the only part used. It is about an inch in circumference, and from six to twelve long; when ripe, brown, smooth, and contains, besides the seeds, a large quantity of a brown mealy substance, which the natives eat; its taste is sweetish and agreeable; it may therefore be compared to the Spanish Algaroba, or locust-tree. (Ceratonia Siliqua Limn.)

$$

In compliance with Dr. Kense's opinion, Ihave called this a Prosopis, though I am aware that the antheral glands give it a claim to the genus Adenanthera.

## ( 422 )

## TO THE

RIGHT HON. SIR JOHN SHORE, BART. GOVERNOR-GENERAL, AND PRESIDENT OF THE ASTIATIC SOCIETY.
DEAR SIR,

IHAVE had from Mr. Goldingham (one of the Honourable Company's astronomers at Fort Saint George, a person of much ingenuity, and who applies himself to the study of antiquities) some drawings taken from the cave on the island of Elephanta* They are the most accurate of any I have seen, and accompanied with a correct description. This gentleman argues ably in favour of its having been an Hindu temple; yet I cannot assent to his opinion. The immense excavations cut out of the solid rock at the Elepbanta, and other caves of the like nature on the island of Salsette, appear to me operations of too great labour to have been executed by the hands of so feeble and effeminate a race as the aborigines of India have generally been held to be, and still continue: and the few figures that yet remain entire, represent persons totally distinct in exterior from the present Hindus, being of a gigantic size, having large prominent faces, and bearing some resemblance to the Abyssinians, who inhabit the country on the west side of the Red Sea, opposite to Arabia. There is no tradition of these caves having been frequented by the Hindus as places of worship; and at this period no poojah is performed at any of them; and they are scarcely

$$
(423)
$$

scarcely ever visited by the natives. I recollect particularly, that Ragonath Row, when at Bombay, did not at all hold them in any degree of veneration.

I flatter myself that you, Sir, will agree with me in thinking the accompanying Memoir deserving of being inserted in our proceedings.

Mr. Goldingham acquaints me, that he has paid two visits to some curious remains of antiquity, about thirty-five miles southerly of Madras, commonly, known by the name of the Seven Parodas. He promises to transmit to me his remarks on these curiosities, with copies of the inscriptions, which are in characters unknown to the people of the district. He declares himself highly ambitious of the favor of being admitted into our Society; and I shall be much gratified in being instrumental to his obtaining that favour, from a conviction that he will greatly add to our ptock of information, and prove an useful member.

I cannot conclude an address to you, Sir, as the worthy successor of the gentleman who lately presided over our Society with so much credit to himself and benefit to the public, without adverting to the memory of Sir William Jones, whose universal science and ardent zeal for diffusing knowledge, I have had so many occasious to admire during the course of an acquaintance of twenty-five years.

I have the honour to be, with the greatest respect,
Dear Sir,

Your most faithful and most obedient servant,
J. CARNAC.

Calcutta, 29th fuly, $795^{\circ}$.

## XXXI.

## SOME ACCOUNT OF THE CAVE

IN THE ISLAND OF ELEPHANTA.

BY J. GOLDINGHAM, ESQ.

THE Elephanta Cave, which is situated in a smalk island in the harbour of Bombay, has deservedly attracted the attention of the curious; an elephant of black stone, large as the life, is seen near the landingplace, from which the island probably took its name: the cave is about three quarters of a mile from the beach; the path leading to it lies through a valley; the hills on either side beautifully clothed, and, except when interrupted by the dove calling to her absent mate, a solemn stillness prevails; the mind is fitted for contemplating the approaching scene.

The cave is formed in a hill of stone; its massy roof is supported by rows of columns regularly disposed, but of an order different from any in use with us*; gigantic figures, in relief, are observed on the walls ; these as well as the columns are shaped in the solid rock, and by artists it would appear possessed of some ability, unquestionably of astonishing perseve-

[^23]rance.

Wlen of the Clehhanta Banelin
,
rance. Several of the columns have been levelied, and the figures mutilated, as I am informed, by the Portuguese, who were at the trouble (and no small one) of dragging cannon up the hill, for the better execution of this exploit.-Destructive Superstition seeks not for merit; she commits to the flames and to बestruction, members of a community most valuable, and structures doing honour to human ability!

The wall at the upper end of the cave is crowded with sculpture; the attention is first arrested by a grand bust, representing a being with three heads; the middle face is presented full, and expresses a dignified composure; the head and neck splendidly covered with ornaments. The face on the left is in profile, and the head-dress rich; in one of the hands is a flower, in the cther a fruit resembling a pomegranate; a ring like that worn by the Hindus at present is observed on one of the wrists; the expression of the countenance by no means unpleasant. Different is the head on the right; the face is in profile, the forehead projects, the cyes stares; snakes supply the place of hair, and the representation of a human scull is conspicuous on the covering of the head; one hand grasps a monstrous Cobra de Capella (the hooded snake) the other a smaller; the whole together calculated to strike terror into the beholder. The height of this bust is about cigbteen feet, and the breadth of the middle face about four; but the annexed drawing of this piece of sculpture will give a better idea of it perhaps than words.

Each side of this niche is supported by a gigantic figure leaning on a dwarf, as in the drawing.

A wiche of considerable dimensions, and crowded with figures, on either side the former; in the middle of the niche, on the right, stands a gigantic figure, apparently female, but with one breast only. This figure has four arms, the foremost right hand is leaning on the head of a bull, the other grasps a Cobra de Capella, while a circular shield is observed in the inner left hand; the head is richly ornamented; on the right stands a male, bearing a pronged instrument, resembling a trident; on the left is a female, holding a mace or sceptre; near the principal is a beautiful youth on an elephant; above this is a figure with four heads, supported by swans or geese ; and opposite is a male with four arms, mounted on the shoulders of another, having a sceptre in one of the hands. At the top of the niche small figures in different attitudes are observed, seemingly supported by clouds.

The most conspicuous of the group on the niche to the left, is a male near seventeen feet in height, with four arms; on the left stands a female about fifteen feet high. The same circular rings, worn by the present Hindu women, are observed on the legs and wrists of this figure; the hair bears a like correspondence in the mode of putting it up; the countenance is peculiarly soft, and expressive of gentleness. In the back ground, a figure with four heads, supported by birds, and one with four arms, 'on the shoulders of another, are also observed. Several smaller figures in attendance : one with the right knee bent to theground,
in the attitude of addressing the principal, bears a crese, exactly resembling that in present use. The heads of most of the small male figures have a whimsical appearance, being covered with an exact resemblance of our wigs.

On each side of these groups is a small dark room, sacred in ancient times perhaps to all but the unpolluted Brábinen; but bats, spiders, scorpions, and snakes, are now in the possession.

Left of the last described group, and nearer the side of the cave, is another : a male is observed in the action of leading a female towards a majestic figure seated in the corner of the niche, his head covered like our judges on the bench; the countenance and attitude of the female highly expressive of modesty and a timid reluctance: a male behind urges her forward. Several smaller figures compose this group.

Curiousit is to observe all the female figures have ornaments round the wrists and legs, like those worn by the Hindu women at present, while the males bearing the same correspondence, have ornaments round the wrists only.

Opposite the last niche, and fifty fect nearer the entrance, is another of equal dimensions, inclosing a figure that forcibly arrests the attention: it is a gigantic half-length of a male with eight arms; round one of the left arms a belt, composed of human heads, is seen; a right hand grasps a sword uplifted to sever a figure, seemingly kneeling (but too much mutilated to distinguish it properly) on a block, held in the correspondent left hand; a Cobra de Capella rises under
one arm ; among the singular decorations of the head, a human skull is observed: above are several small figures, represented in distress and pain. Many of the figures mutilated, as is the principal, whose aspect possesses a great degree of unrelenting fierceness.

Crossing to the other side of the cave, near one of the small rooms, before-mentioned, a male sitting as the people of this country do at present is observed; a female in the same posture on his left, with an attendant on either side : at the feet of the male is the figure of a bull couchant; and in each corner of the niche stands a gigantic guard. Opposite is a correspondent niche : the figures being a good deal mutilated, and the situation dark, prevent these being properly discriminated; a sitting male figure, having an attendant on either hand, is however perceived.

A niche filled with figures, greatly defaced, is observed on each side the entrance. On one side is a male that had eight arms, which are all destroyed ; in the back part is the figure with four heads, supported by birds; and the other figure with four arms, whimsically clevated. A large sitting figure is the principal in the opposite niche; a horse and rider in the back ground; the former caparisoned according to the present mode in this country.

On the left side and half way up the cave, is an apartment about thirty feet square, enclosing the Lingam; an entrance on the four sides, and each side of either entrance is supported by a figure seventeen feet in height, each figure being ornamented in a different style.

Tha

The part of this surprising monument of human skill and perseverance hitherto described, is generally called the great cave; its length is 135 feet, and breadth nearly the same. A plan accompanies this account, which, however, I cannot venture to pronounce perfectly correct, having mislaid a memorandum of particular parts which were deduced, and with sufficient correctness perhaps from the general measures preserved. But there are compartments on both sides, separated from the great cave, by harge fragments of rock and loose caith, herctofore probably a part of the roof. That on the right is spacious, and contains several pieces of sculpture: the most remarkable is a large figure, the body human, but the head that of an elephant. The lingam is also enclosed here. Above each of a line of figures, standing in a dark situation, is a piece of sculpture, pointed out to me as an inscription : however (with the assist-ance of a torch) I found one an exact copy of the other, and with little resemblance of characters.
$\mathrm{T}_{\mathrm{he}}$ compartment on the other side contains several sculptures, and among the rest, a figure with an elephant's head and human body. A deep cavity in the rock hereabout contains excellent water, which, being sheltered from the influence of the sun, is always cool, and deservedly held in estimation by those whom curiosity leads here through a scorching atmosphere. A traditionalaccount of the extent of this cavity, and the communication of its waters by subterraenous passages, with others, very distant, was given
me by a native of the island, which would make a considerable figure in the hands of a poet.
Gigantic as the figures are, the mind is not disagreeably moved on viewing them, a certain indication of the harmony of the proportions. Having measured three or four, and examined the proportions by the seale we allow the most correct, I found many stood even this test, while the disagreements were not equal to what are met with every day in people whom we think by no means ill proportioned.

The island wherein these curious remains of antiquity are situated, is about five miles and a half from Bonbay, in an easterly direction; its circumference cannot be more than five miles: a neat village near the landing-place contains all its inhabitants, whom, inclusive of women and children, number about one hundred. Their ancestors, they tell you, having been improperly treated by the Portuguese, fled from the opposite island of Salset hither, cultivating rice, and rearing goats for their support. In the same humble road do they continue. The islanders have no boat; they cut wood from the adjoining hills, which the purchasers remove in boats of their own; they are under our protection, and pay about fifty-six pounds annually to the government; the surplus revenue furnishes their simple clothing. By persevering in this humble path, these harmless people continue to rejoice in tranquillity under their banyan-tree. The cave, they tell you, was formed by the Gods: and this is all they pretend to know of the matter.

Various have been, and are to this day, the con-
jectures respecting the Eleplonta Cave. Those who attempt to deduce its origin from the Egyptians, from the ferws, or from Alexander the Great, appear to me , with due deference, to give themselves much un $\uparrow$ necessary trouble; which I shall further endeavour to shew as briefly as the subject will admit of, though at the same time it must be observed, that resembling features are not wanting in the case of the Egyptians and of the Feros, to lead towards such deductions; but these resemblances strike me as tending to the elucidation of a more interesting hypothesis, viz. That the systems of those people were copies of an original, found in this part of the roorld.

The striking resemblance in several particulars of the figures in the cave to the present Hindu race, would induce those who from history, as well as from observation, have reason to believe they have preserved the same customs from times immemorial, to imagine the ancestors of these people its fabricators; but those who are in a small degree acquainted with their mytho$\log \%$, will be persuaded of it; nor is a much greater extent of knowledge requisite to enable us to discover it to be a temple dedicated principally to Siva, the destrover or changer.

The bust is doubtless a personification of the three grand Hindu attributes of that Being for coboon the ancient Hindus entertained the most profound veneration, and of whom they had the most stiblime conceptions. The middle head represents Brahma, or the creative attribute; that on the left, Vishanu, or the
preserving; and the head on the right, Siva; or the destructive or changing attribute.

The figure with one breast has been thought by most to repiesent an Amazon; it however, appears to me a representation of the consort of SivA, exhibiting the active power of her lord; not only as Bawani, or courage, but as Is ani, or the goddess of nature, con $*$ sidered as male and female, and presiding over gene.* ration, and also as Durga. Here we find the bull of Iswara (one of Siva's names) and the figure bearing his trisulc, or trident. The beautiful figure on the elephant is, I imagine, Cama, or the Hindu God of Love; the figure with four beads, supported by birds, is a representation of $\mathrm{Brahma}_{\mathrm{A}}$; and that with four arms, mounted on the shoulders of another, is Vishnu.

The two principal figures in the niche to the left, represent, perhaps, Siva and his Goddess as Parvati. Here, as before, we observe Brahma and Vishnu in the back gromid.

The terrific figure with eight arms has been much talked of; some will have it to represent Solomon, threatening to divide the harlot's child; others, with more reason on their side, suppose it to represent the tyrant Cansi, attempting the life of the infant God Crisina, when fostered by the herdsman Ananda. To me, the third attribute, or the destroyer in action, appears too well represented to be mistaken. The distant scene, where the smaller figures appear in distress and pain, is perhaps the infernal regions. The figure about to be destroyed, does not seem to me an infant, but a full grown person; if, indeed, the $d e-$
stroyer was of the human size, the figure in question would bear the proper proportion as an infant; but as he is of enormous magnitude, a human being, full grown, would appear but an infant by the side of him; and thus it, is, I imagine, that poople have been deceived: a case by no means uncommon in circumstances like the present.

The sitting male and female figures, having à bull couching at the fect of the former, are Sivs and his Goddess; and thus are they represented in the pagodas of the present day.

No person can mistake the figure with the human body and elephant's head for any other than Gase's A, the Hindu God of Wisdom, and the first born of Siva; and thus is he represented at present.

From what has been advanced, it will appear incontestible, I imagine, that this is a Hindu temple; whence the Lingam is a testimony sufficient of SIVA's having presided here, without the other evidences which the intelligent in the Hindu mythology will have discovered in the course of this account.

To deduce the xra of the fabrication of this structure is not so easy a task; but it was, no doubt, posterior to the great schism in the Hindu religion, which, according to the Puranus, 1 learn, happened at a period coeval with our date of the creation. Be this as it may, we have accounts of powerful princes who ruled this part of the country of a later date, particularly of one who usurped the government in the nincticth ycar of the Christion æra, famed for a passion for architecture. Many worse hypothesis have

$$
\text { Vor. IV. } 3 \mathrm{~F} \text { been, }
$$

been, than one which might be formed of his having founded the cave; but I am led to imagine, no certain conclusions on this dark subject could be drawn from the sources of information open at present.

\text { AN ACGOUNT OF THE PRESENT STATE } \\
\text { OF DELHI. }
\end{gathered}
$$

## BY LIEUTENANT W. FRANKLIN.

THE cnce celebrated city of Delbi, the capital of Mussulman sovereignty in Hindostan, and, in more early times, the seat of Hindu dominion over northern India, has employed the pen of many different authors, Asiatic and European; though of the latter in a less degree than might have been expected.

The following account of the present state of this ancient city, is extracted from a journal of observations made during an official tour through the Dovab and the adjacent districts, in company with Captain Reynolds, of the Bombay establishment, appointed by the Bengal government to survey that part of the country in the year 1793.

It cannot be supposed to contain much new information on things already described by others; but, as a faithful statement of the actual condition of the
once
once flourishing metropolis of a great kingdom now in ruins, it may be acceptable; and in this hope it is offered, with deference to the Socicty; who will judge whether it be deserving of more general diffusion by publication with their more important researches.

The extent of the ruins of old Delbi cannot, I suppose, be less than a circumference of twenty miles, reckoning from the gardens of Sbalimar, on the northwest, to the Kuttub Minar on the south-east; and proceeding from thence along the heart of the old city by way of the mausoleum of Nizam-u-deen, on which stands Humaroon's tomb, and the old fort of Delbi on the banks of the Fumna, to the Aj-mere-gate of Shah Felanabad.

The environs to the north-west are crowded with the remains of spacious gardens and country-houses of the nobility, which were formerly abundantly supplied with water by means of the noble canal dug by Ali Mirdan Khan, and which formerly extended from above Paniput quite down to Delbi, where it joined the $\begin{aligned} & \text { fumna; }\end{aligned}$ fertilizing in its course a tract of more than ninety miles in length, and bestowing comfort and affluence on those who lived within its extent. This canal, as it ran through the suburbs of Mogul Parah, nearly three miles in length, was about twentyfive feet deep, and about as much in breadth, cut from the solid stone-quarry, on each side, from which most of the houses in the neighbourhood have been built. It had small bridges erected over it at different

$$
3 \mathrm{~F}=\text { places, }
$$

places, some of which communicated with the gar-den-houses of the nobility.

Is the year of the Hagiree 104 I (A. C. 1631-2) the Emperor Shah-Jehan founded the present city and palace of Shab-Fchanabad, which he made his capital during the remainder of his reign. The new city of Sball-Fcbanabad lies on the western bank of the Fumna, in latitude $28^{\circ} 36^{\prime}$ north. The city is about seven miles in circumference, and is surrounded on three sides by a wall of brick and stone; a parapet runs along the whole, with loopholes for musquetry; but there are no cannon planted on the ramparts. The dity has seven gates; viz. Labore gate, Ajmere gate, Turkoman gate, Delbi gate, Moor gate, Cabul gate, and Casbmere gate; all of which are built of freestone, and have handsome arched entrances of stone', where the guards of the city keep watch. Near the Ajmere gate is a Madrissa, or college, erected by Ghazi-u-defn Khan, nephew of NizamedeMooluck: it is built of red stone, and situated at the centre of a spacious quadrangle, with a stone fountain. At the upper end of the area is a handsome mosque built of red stone, inlaid with white marble. The apartmeitts for the students are on the sides of the square, divided into separate chambers, which are small but commodious. The tomb of Ghazi is in the corner of the square, surrounded by a shrine of white marble, pierced with lattice-work. The college is now shut up, and without inhabitants. In the neighbourhood of the Cabul gate is a garden, called Tees Huzarri Baug, in which is the tomb of the
queen Malka-Zemani, wife of the emperor Mohummud Shar: a marble tablet, placed at the head of the grave, is engraved with some Persian coupl ets informing us of the date of her death, which happened five years since, amn. Hagiree 1203. Near this omb is another, of the princess Zeebul Nissah Beecum, daughter of $A$ urungzebe. On a rising ground rear this garden, from whence there is a fine prosf ect of Sbab Febanabad, are two broken columns of brown granate, eight feet high, and two and a half in breadth, on which are inscriptions in an ancient character.

Within the city of new Delbi are the remains of many splendid palaces, belonging to the great Omrahs of the empire. Among the largest are those of Kummer-u-deen Khan, Vizier to Mohummud Shah; Ali Mirdan Khan, the Persion; the Nabob Ghazi-u-deen Khan; Sefdur Jung's; the garden of Coodseah Begum, mother to Mohummud Shar; the palace of Sadut Khan; and that of Sultan Darah Shekoah. All these palaces are surrounded with high walls, and take up a considerable space of ground. Their entrances are through lofty arched gateways of brick and stone, at the top of which are the galleries for music: before each is a spacious court-yard for the elephants, horses, and attendants of the visitors. Each palace has likewise a Mabal, or Seraglio, adjoining; which is separated from the Dewean Kbaya by a partition-wall, and communicates by means of private passages. All of them had gardens with capacious stone reservoirs and fountains in the centre; an ample terrace extended round the whole of each particular palace; and
within the walls were houses and apartments for servants and followers of every description, besides stabling for horses, Feel Khanas, and every thing belonging to a nobleman's suit. Each palace was likewise provided with a handsome set of baths, and a Teb Khana under ground. The baths of Sadut Khan are a set of beautiful rooms, paved and lined with white marble: they consist of five distinct apartments, into which light is admitted by glazed windows from the top of the domes. Sufder Jung's Teb Kbana consists of a set of apartments, built in a light delicate manner; one long room, in which is a marble reservoir, the whole length, and a small room, raised and ballustraded on each side, both faced throughout with white marble.

Shah Jehanabad is adorned with many fine mosques, several of which are still in perfect beauty and repair. The following are most worthy of being described: the first, the fanla Musjed, or great cathedral. This mosque is situated about a quarter of a mile from the royal palace; the foundation of it was laid upon a rocky eminence, named fujula Pabar, and has been scarped on purpose. The ascent to it is by a flight of stone steps, thirty-five in number, through a handsome gateway of red stone. The doors of this gateway are covered throughout with plates of wrought brass, which Mr. Bernier imagined to be copper. The terrace on which the mosque is stuated, is a square of about fourteen hundred yards of red stone; in the centre is a fountain lined with marble, for the purpose of performing the necessary ablutions previous to prayer. An arched colonade of red
stone surrounds the whole of the terrace, which is adorned with octagon pavillions at convenient diftance, for sitting in. The mosque is of an oblong form, two hundred and sixty-one fect in dength, surrounded at top by three magnificent domes of white marble, intersected with black stripes, and flanked by two Minarets of black marble and red stone alternately, rising to the height of a hundred and thirty feet. Each of these Minarets has three projecting galleries of white marble; and their summits are crowned with light octagon pavillions of the same. The whole front of the Fama Musjed is faced with large slabs of beautiful white marble; and along the cornice are ten compartments, four feet long, and two and a half broad, which are inlaid with inscriptions in black marble, in the Nuski character, and are said to contain great part, if not the whole, of the Koran. The inside of the mosque is paved throughout with large flags of white marble, decorated with a black border; and is wonderfully beautiful and delicate: the flags are about three feet in length by one and a half broad. The walls and roof are lined with plain white marble; and near the Kibla is a handsome taak, or niche, adorned with a profusion of freeze-work. Close to this is a mimber, or pulpit, of marble, having an ascent of four steps, and ballustraded. The ascent to the Minarets is by a winding stair-case of a hundred and thirty seps of red stone; and at the top you have a noble view of the !ing's palace, and the whole of the Cuttub Minar, the Kurrun Minar, Humaioon's tomb, the palace of Ferose Shah, the fort of old Delbi,
and the fort of Loni, on the opposite of the 'fumma. The domes are crowned with cullises, richly gilt, and present a glittering appearance from a distance. This mosque was begun by Shab Jehan, in the fourth year of his reign, and completed in the tenth: the expences of its erection amounted to ten lacks of rupees; and it is in every respect worthy of being the grand cathedral of the empire of Indostan.

Nor far from the palace is the mosque of Roshun-A-Dowlah, rendered memorable to the Delbians for being the place where Nadir Shah saw the massacre of the unfortunate inhabitants. The cause assigned by historians for this unhuman act is, that a sedition broke out in the great market, in which two thousand Persians were slain. Nadir, on hearing of the tumult, marched out of the fort at night with a small force to the Musjed of Roshun-a-Dowlah; where he was fired upon in the morning from a neighbouring terrace, and an officer killed close by his side. He instantly ordered an indiscriminate slaughter of the inhabitants; and his squadrons of cavalry pouring through the streets, before the afternoon put to death a hundred thousand persons of all descriptions. "The King of Persia," says the translator of Ferishta, " sat, during the dreadful scene, " in the Musjed of Roshun-a-Dowlah. None but " slaves durst come near him, for his countenance " was dark and terrible. At length the unfortunate " Emperor, attended by a number of his chief Om" rahs, ventured to approach him with downcast "eyes. The Omrahs who preceded Mohummud, " bowed
s6 bowed down their foreheads to the ground. Naer dir Sinah sternly asked them what they wanted; " they cried out with one voice, Spare the city. " Mōhummud said not a word, but tears flowed "fast from his eyes; the tyrant, for once touched " with pity, sheathed his sword, and said, For the "s sake of the prince Mohummud, I forgive." Since this dreadful massacre this quarter of $D e l b i$ has been but very thinly inhabited. The mosque of Roshun-A-Dow an is situated at the entrance of the Chandney Choke, or market ; it is built of red stone, of the cemmon size, and surmounted by three domes richly gilt.

Zeenul-al Mussijid, or the ornament of mosques, is on the banks of the $\mathcal{F u m}$, and was erected by a daughter of AURUNGZEBE, of the name of芑eenutal Nissa'h. It is of red stone with inlayings of marble, and has a spacious terrace in front of it, with a capacious reservoir faced with marble. The princess who built it, having declined entering into the marriage state, laid out a large sum of money in the above mosque, and, on completing it, she built a small sepulchre of white marble, surrounded by a wall of the same, in the west corner of the terrace. In this tomb she was buried in the year of the Hegira 1122, corresponding with the year of Christ 1710. There were formerly lands alloted for the support and repairs of this place, amounting to a lack of rupees per anmum; but they all have been confiscated during the troubles this city has undergone. Exclusive of the mosques above described, there are
in Shab frehanabad and its invirons above forty others; but as most of them are of inferior size, and all of them of the same fashion, it is unnecessary to present any further detail.

The modern city of Sbab Yebanabad is rebuilt, and contains many good houses, chiefly of brick. The streets are in general narrow, as is usual in most of the large cities in $A$ sia; but there were formerly two wery noble streets; the first leading from the palace gate through the city to the Delbi gate, in a direction north and south. This street was broad and spaclous, having handsome houses on each side of the way, and merchants shops well furnished with the xichest articles of all kinds. Shab Jehax caused an aqueduct to be made of red stone, which conveyed she water aiong the whole length of the street, and from thence into the royal gardens, by means of a rescrvoir under ground. Some remains of the aqueduct are still to be seen; but it is choked up in most parts with rubbish. The second grand street was likewise from the palace to the Labor gate, lying east and west: it was equal in many respects to the former; but in both of them the inhabitants have spoiled their appearance, by running a line of houses down the centre, and across the streets in other places, so that it is with difficulty a person can discover their former situation without a narrow inspection. The bazars in Delbi are but indifferently furnished at present, and the population of the city miserably reduced of late years: the Cbandney Choke is the best fursished bazar in the city, though the commerce is
very trifling. Cotton cloths are still manufactured, and the inhabitants export indigo. Their chief imports are by means of the northern caravans which come once a year, and bring with them from Cabul and Gasbmere shaw!s, fruit, and horses; the two former articles are procurabie in Dellhi at a reasonable rate. There is also a manufacture at Delbi for beedree hooka bottoms. The cultivation about the city is principally on the banks of the Yumna, where it is very good; the neighbourhood produces corn and rice, millet and indigo. The limes are very large and fine. Precious stones likewise are to be had at Delhi, of very good quality, particularly the large red and black cornelians; and peerozas are sold in the bazars.

The city is divided into thirty-six mohauls or quarters, each of which is named either after the particular Omrah who resided there, or from some local circumstance relative to the place. It appears that the modern city of Sbalb Felianabad has. been built principally upon two rocky eminences; the one where the Famia Musjid is situated, named Fujula Pahar ; and the other, the quarter of the oilsellers, called Bejula Pabar: from both of these eminences you have a commanding view of the remainder of the city. Ancient Delbi is said by historians to have been erected by Rajah Delu, who reigned in, Hindostan prior to the invasion of Alexander the Great ; others affirm it to have been built by Rajah Pettourah, who flourished in a much later period. It is called in Sanscrit Indraput, or the abode of Indra, one of the Hindu deities; and it is also
thus distinguished in the royal diplomas of the chancery office. Whether the city be of the antiquity seported, it is difficult to determine : but this much is certain, that the vast quantity of buildings which are to be found in the environs for upwards of twenty miles in extent, as well as their grandeur and style of architecture, prove it to have once been a rich, flourishing, and populous city.

On $^{\prime}$ the irth of March we were presented to the King Shah Allum. After entering the palace, we were carried to the Dewamh Kbanch, or hall of audience for the nobility, in the middle of which was a throne raised about a foot and a half from the ground. In the centre of this elevation was placed a chair of crimson velvet, bound with gold clasps, and over the whole was thrown an embroidered covering of gold and silver thread: a handsome Samianah, supported by four pillars incrusted with silver, was placed over the chair of state. The King at this time was in the tiusbeah Khanab: ain apartment in which he generally sits. On passing a skreen of Iudian connaughts, we proceeded to the front of the Tusbeab Kibanah, and being arrived in the presence of the King, each of us made three obcisances in turn, by throwing down the right hand pretty low, and afterwards raising it to the forehead; we then went up to the Musnud on which his Majesty was sitting, and presented our nuzzers on white handkerchiefs, each of our names being announced at the time we offered them : the King received the whole, and gave the nuzzers to Mrrza Akber Suan, and two other prinçes who sat on his
left hand. We then went back, with our faces towards the presence, made the same obeisance as before, and returned again to the Musnud. After a slight conversation, we were directed to go withous the inclosure, and put on the Ribelauts which his Majesty ordered for us; they consisted of light India dresses; a turban, jammah, and kummerbund, all cotton, with small gold sprigs. On being clothed in these dresses, we again returned to the Tusbeab Khanak, and after a few minutes stay, previous to which Captain Rey nolds reccived a sword from the King, we had our dismission; and some servants were ordered to attend us in viewing the palace.

The present King, Shah Allum, is seventy-two jears of age; of a tall commanding stature, and dark complexion; his deportment was dignified, and not at all diminished by his want of sight, though he has suffered that cruel misfortune above five years. The marks of age are very strongly discernible in his countenance: his beard is short and white. His Majesty appeared at our introduction to be in good spirits; said he was happy at our arrival; and desired we would visit his palace and the fort of Sclim Gbur. He was dressed in a rich khecm-khaub, and was supported by pillows of the same materials.

I magened I could obscrive in his aspect a thoughtfulness, as if sufficiently well acquainted with his present degraded situation, and the recollection of his former state.

The palace of the royal family of Timur was erected by the Emperor Shah Jehan at the time he finished
finished the new city: it is situated on the westert bank of the $\mathcal{F u m n a}$, and surrounded on three sides by a wall of red stone. I suppose the circumference of the whole to be about a mile. The two stone figures, mentioned by Berifer, at the entrance of the palace, which represented the Rajah of Cbitore and his brother Pottaif, seated on two elephants of stone, are not now to be seen; they were removed by order of Aurungzebe, as favouring too much of idolatry; and he enclosed the place where they stood with a skreen of red stone, which has disfigured the entrance of the palace. The first object that attracts the attention after entering the palace, is the Derwaun Aum, or public hall of audience, for all descriptions of people. It is situated at the upper end of a spacious square, and is a noble building, but at present much in decay. On each side of the Dewaun Aum, and all round this square, are apartments of two stories high, the walls and front of which, in the times of the splendor of the empire, were adorned with a profusion of the richest tapestry, velvets, and silks; the nobles vying with each other in rendering them the most magnificent, especially on festivals, and đays of public rejoicings, when they presented a grand sight. These decorations have however been long since laid aside, and nothing but the bare walls remained. From the Dewaun Aum, we proceeded thro' another handsome gateway to the Dewaun Kbass, before mentioned. The building is situated at the upper end of a spacious square, and elevated upon a marble terrace, about four feet high. The Dewaunt

Khass in former times has been adorned with excessive magnificence, and though stripped and plundered by various invaders, still retains sufficient beauty to render it admired. I judge the building to be a hundred and fifty feet in length, by forty in breadth. The roof is flat, supported by a great many columns of fine white marble, which have been richly adorned with inlaid flower-work of beautiful stones : the cornices and borders have been decorated with a great quantity of frieze and sculptured work. The ceiling was formerly incrusted with a work of rich foliage of silver throughout the whole extent, which has been long since taken off and carried away. The delicacy of the inlaying in the compartments of the walls is much to be admired; and it is matter of heartfelt regret to see the barbarous ravages that have been made in picking out the different comelians, and breaking the marble by violence. Around the interior of the Dewaun Kbass, in the cornice, are the following lines, engraved in letters of gold, upon a white marble ground:
" If there be a paradise upon earth, this is it-'tis this, 'tis this." The terrace on which the Dezounn Kbanah is built is composed of large beautiful slabs of white marble; and the building is crowned at top with four pavillions or cupolas, of the same materials.

Theroyal baths, built by Shah Jehan, are situated a little to the northward of the Dewaun Kbass, and consist of three very large apartments surmounted by white marble domes. The inside of the baths is lined, about two thirds of the way up, with marble,
ble, having a beautiful border of flower-worked cotnelians and other precious stones, executed with taste. The floors are paved throughout with marble in large slabs, and there is a fountain in the centre of each, with many pipes: large reservoirs of marble, about four feet deep, are placed in different parts of the walls; the light is admitted from the roof by windows of party-coloured glasses; and capacious stones, with iron gratings, are placed underneath each separate apartment. There is a noble mosque adjoining, entirely of white marble, and made after the fashion described above. In the Shals Batg, or the royal gardens, is a very large octagon room, which looks towards the river Fumna. This. room is called Shath Boorj, or the royal tower; it is lined with marble; and from the window of it the late heir apparent, Mirza Juwan Bukht, made his escape in the year 1784 , when he fled to Lucknow: he descended by means of a ladder made with turbans; and as the height is inconsiderable, effected it with ease. A great part of this noble palace has suffered very much by the destructive ravages of the fate invaders. The Robillas in particular, who were introduced by Gholaum Kauder, have stripped many of the rooms of their marble ornaments and pavements, and have even picked out the stones from the borders of many of the floorings. Adjoining is the fortress of Sclimu Glour, which you reach by a stone bridge, built over an arm of the Funna. The fort is now entirely in ruins. At the eastern end of it we were shewn the sally-port, from which Golaum Kauder Kian made his escape with all his rec tilue,
tinue, when the place was besieged by the Mahrattas in 1788. The river Jumna running directly underneath this bastion, the tyrant crossed it immediately, and fled to Meerut, in the Dooab.

The Gentur Munter, or observatory, in the vicinity of Delhi, has been described by former travellers. It was built in the third year of the reign of MoHummed Shah, by the Rajah Jeysing, who was assisted by many persons celebrated for their science in astronomy from Persia, India, and Europe; but died before the work was completed; and it has since been plundered, and almost destroyed by the Jeits, under Juwahier Sing.
I wre only add a short account of the royal gardens of Shatimar. 'These gardens, made by the Emperor Shah Jelan, were begun in the fourth year of his reign, and finimed in the thirteenth ; on which occasion, according to Colonel Dow, the Emperor gave a grand festival to his court. These gardens were laid out with admirable taste, and cost the enormous sum of a milion sterling : at present their appearance does not give cause to suppose such an immense sum has been laid out upon them; but great part of the most valuable and costly materials have been carried away. The entrance to them is through a gateway of brick; and a canal, lined with stone, having walks on each side with a brick-parement, leads up to the Deciaun Khanah, or hall of audience ; most part of which is now fallen down:- from thence, by a noble canal, having a fountain in the center, you proceed to the apartments of the Haram, which embrace a large extent of
Voi.IV. Gg ground.
ground. In the front is an Ivan, or open hall, with adjoining apartments; the interior of which are decorated with a beautiful border of white and gold painting, upon a ground of the finest chunam. At the upper end of this Ivan was formerly a marble throne, raised about three feet from the ground; all of which is removed. On each side of this lvan, inclosed by high walls, are the apartments of the Haram, some of which are built of red stone, and some of the brick faced with fine chunam, and decorated with paintings of flowers of various patterns. All these apartments have winding passages which communicate with each other, and the gardens adjoining by private doors. The extent of Shalimar does not appear to have been large: I suppose the gardens altogether are not above a mile in circumference. A high brick-wall runs around the whole, which is destroyed in many parts of it, and the extremities are flanked with octagon pavilions of red stone. The gardens still abound with trees of a very large size, and very old. The prospect to the southward of Shalimar towards Delhi, as far as the eye can reach, is covered with the remains of extensive gardens, pavilions, mosques, and bury-ing-places, all desolate and in ruins. The environs of this once magnificent and celebrated city appear now nothing more than a shapeless heap of ruins; and the country round about is equally forlorn.

## BOTANICAL OBSERVATIONS

ON THE SPIKENARD OF THE ANTIENTS:
intended as a Supplement to the late
Sir William Jones's Papers on that Plant.
by william roxburgh, m. d.

## VALERIANA JATAMANSI.

> GENERIC CHARACTER.

FLOWERS triandrous, leaves entire, four-fold, the inner radical pair petioled, and cordate ; the rest smaller, sessile, and sub-lanceolate ; seeds crowned with a pappus.
V. Jatamansi of Sir William Jones. See Asiatic Researches, vol. 2, page 405,417 , and page 118 of this volume.

November 6th, 1794. I received from the Honourable C. A. Bruce, Commissioner at Coos-Beyhar, two small baskets with plants of this valuable drug. He writes to me on the 27 th Seplember (so long had the plants been on the road) that he had, the day before, received them from the Deb Rajuh of Bootan; and further says, that the Booteatis know the plant by two names, viz. Julamansi and Pampé, or Paumpé.

$$
\mathrm{Gg}_{2} \text { I NEED }
$$

I NEED scarce attempt to give any further history of this famous odoriferous plant than what is merely botanical ; and that with a view to help to illustrate the learned dissertations thereon, by the late Sir William Jones, in the 2 d and $4^{\text {th }}$ volumes of these Researches; and chiefly by pointing out the part of the plant known by the name Indian Nard, or Spikenard: a question on which Matheolus, the commentator of Dioscorides, bestows a great deal of argument; viz. Whether the roots or stalks were the parts esteemed for use ! the testimony of the antients themselves on this head being ambiguous. It is therefore necessary for those who wish for a more particular account of it, to be aiquainted with what that gentleman has published on the subject.

TaE plants now received, are growing in two small baskets of earth; in each basket there appears above the earth between thirty and fory hairy spike-like bodies, but more justly compared to the tails of $E r$ mines, or small Weasels*; from the apex of each, or at least of the greatest part of them, there is a smooth lanceolate, or lanceolate-oblong, three or five-nerved, short-petioled, acute or obtuse, slightly serrulate leaf or two shooting forth. Fig. I. represents one of them in the above state; and on gently removing the fibres

[^24]or hairs which surround the short petiols of these leaves, I find it consists of numerous sheaths, of which one, two, or three of the upper or interior ones are entire, and have their fibres connected by a lightbrown coloured nembranous substance, as at $b$; but in the lower exterior sheaths, where this connecting membrane is decayed, the more durable hair-like fibres remain distinct, giving to the whole the appearance of an Ermine's tail: this part, as well as the roor, are evidently perennial*. The root itself (beginning at the surface of the earth where the fibrous envelope ends) is from three to twelve inches long, covered with a pretty thick light-brown coloured bark: from the main root, which is sometimes divided, there issues

[^25]
## 454 BOTANICAL OBSERVATIONS ON

several smaller fibres. Fig. 2, is another plant with a long root; here the hair-like sheaths, beginning at a, are separated from this, the perennial part of the stem, and turned to the right side ; at the apear is.seen the young shoot, marked 6 ; which is not so far advanced as at Fig. 1; ccc show the remains of last year's annual stem. When the young shoot is a little further advanced than in Fig. 2, and not so far as ins Fig, 1 , they resemble the young convolute shoots of monocotyledonous plants, June $\ddagger 99$. The whole of the abovementioned plants have perished without producing flowers, notwithstanding every care that could possibly be taken of them. The principal figure in the drawing, marked Fig. 3 , and the following description, as well as the above definition, are therefore chiefly extracted from the engraving and description in the second volume of these Researches, and. from the information communicated to me by Mr. Burt, the gentleman who had charge of the plants that flowered at Gaych, and who gave Sir IWilliam Jones the drawing and description thereof.

## Description of the Plant.

Root, it is already described above. Stem, lower part perennial, involved in fibrous shearhs; \&c. as above described; the upper part herbaceous suberect, simple, from six to twelve inches long.
Leaves four-fold, the lowermost pair of the four radical are opposite, sessile, oblong, forming, as it were, 2 two-valved spathe; the other pair are also oppo- those of the stem sessile and lanceolate; all are smooth on both sides.
Corymb terminal, first division trichotomous.
Bracts awled.
Calyx scaice any.
Corol one petaled, funnel-shaped, tube somewhat gibbous. Border five-cleft.
Stamens, filaments three, project above the tube of the corol; anthers incumbent.
Pistil, germ beneath. Style erect, length of the tube. Stigma simple.
Pericarp, a single seed crowned with a pappus.

[^18]:    * Ir is perhaps a wonder, that islands so extensive, and lying in the track of so many ships, should have been, till of late years, so little known; that while the countries by which they are almost encircled, have been increasing in population and wealth, having been from time immemorial in a state of a tolerable civilization, these islands should have remained in a state of nature, and their inhabjtants plunged in the grossest ignorance and barbarity.

    Thewild appearance of the country, and the untractable and ferocious disposition of the natives, hare been the causes, probably, which have deterred navigators from frequenting them; and they have justly dreaded a shipwreck at the Andamaus more than the danger of foundering in the ocean; for although it is highly probable, that in the course of time nany vesel have been wrecked upon their coasts, an instance does not occur of any of the crews being saved, o: of a single person returning to give any account of such a disaster.

    > VoL. IV.

    small

[^19]:    * I am indebted to Major Kyd and Captain Archibald Blair for many of the subsequent remarks. The latter was employed by government in surveying these islands, and has the credit of having firnished the first complete and correct Chart of the Audamans.

[^20]:    * In this respect they differ from all the various tribes inhabiting the continent of $A$ sia, or its islands. A story is somewhere told of a ship full of African slaves, of both sexes, having been cast away at the Andamans; and that having put to death their masters and the ship's crew, they spread themselves over, and peopled the country. This story does not appear to have been well authenticated, nor have I ever met with the particular author who relates it. They have been asserted by some to be cannibals, and by others (vide Captain Hamilton's Voyage, and all the Gcographical Dictionaries) to be a harmless and inoffensive people, living chiely on rice and vegetables. That they are cannibals has never been fully proved, although from their cruel and sanguinary disposition, great roracity, and cunning modes of lying in ambush, there is reason to suspect, that in attacking strangers they are frequently impelled by hunger, as they invariably put to death the unfortunate victims who fall under their hands. No positive instance, however, has been known of their eating the flesh of their enemies; although the bodics of some whom they have killed, have been found nangled and torn. It would be difficult to account for their unremitting hostility to strangers, without aseribing this as the cause, unless the story of their origin, as abovementioned,

[^21]:    * The eastermost cluster of the Andaman islands.

[^22]:    Vol. IV,
    E e
    breaches

[^23]:    * See the sketch of one of the pillars.

[^24]:    * The term spica, or spike, is not so ill applied to this substance as may be imagined; several of the Indian grasses, well known to me, have spikes almoft exactly resembling a single straight piece of nardus; and when those hairs (or flexible arista like bristles) ar* removed, Pliny's words, "frutexradice pingui et crassa," are by no means inapplicable." Sce Fig. 2, from a to b.

[^25]:    * The above described perennial hairy portion of the plant, is clearly the Indian spikenard of our shops; but whether the nardus of the antients or not, I leave to better judges to determine ; however, I believe fesy will doubt it after having read Sir William Jones's Dissertations thereon, and compared what he fays with the accompanying drawings of the perennia! hairy part of the stem of this plant, which are taken from the living plants immediately undermy own eyes: the drawing of the herbaceous, or upper part of the plant, is out of the queftion in determining this point, and only refers to the place the plant bears in our botanical books. While. writing the above, I desired an Hindu servant to go and buy me from their apothecaries shops a little Fatamansi. Without saying more or less, he inmediately went and brought me several pieces of the very identical drug I have been describing: a drawing of one of the pieces is represented ar Fig. 4, and agrees not only with those I have taken from the living plants, but also exceedingly well with Garcias ab Orta's figure of the nardus indica, which is to be found at page 129 of the fourth edition of Clusius's Latin translations of bis Hissory of Indian Diugs, published in 1693.
